[8] Saarto T, Wiffen PJ. Antidepressants for neuropathic pain. The Cochrane Database of Systematic Reviews 2005, Issue 3. Art. No.: CD005454. DOI: 10.1002/14651858.CD005454. (Wong MC, Chung JW, Wong TK. Effects of treatments for symptoms of painful diabetic neuropathy: systematic review. BMJ. 2007 Jun 11; [Epub ahead of print] Anticonvulsants and antidepressants are still the most commonly used options to manage diabetic neuropathy. Oral tricyclic antidepressants and traditional anticonvulsants are better for short term pain relief than newer generation anticonvulsants. Evidence of the long term effects of oral antidepressants and anticonvulsants is still lacking. Further studies are needed on opioids, N-methyl-D-aspartate antagonists, and ion channel blockers. (InfoPOEMs: Capsaicin and tricyclic antidepressants produce the best response in patients with short-term painful diabetic neuropathy. If these are ineffective, valproate or carbamazepine (Tegretol) should be the next choice, since they are more effective than the new anticonvulsants pregabalin (Lyrica) and gabapentin (Neurontin). Duloxetine (Cymbalta, Yentreve) and opioids also have some evidence of benefit, but not to the same degree as the other choices. (LOE = 1a)))

Cochrane Database of Systematic Reviews 2005, Issue 2. Art. No.: CD002946. DOI: 10.1002/14651858.CD002946.pub2. (Clegg et al. Glucosamine, chondroitin sulfate, and the two in combination for painful knee osteoarthritis. N Engl J Med. 2006 Feb 23;354(8):795-808. InfoPOEMs: 03May2006. **Glucosamine** This update includes 20 studies with 2570 patients. Pooled results from studies using a non-Rotta preparation or adequate allocation concealment failed to show benefit in pain and WOMAC function while those studies evaluating the Rotta preparation show that glucosamine was superior to placebo in the treatment of pain and functional impairment resulting from symptomatic OA. WOMAC outcomes of pain, stiffness and function did not show a superiority of glucosamine over placebo for both Rotta and non-Rotta preparations of glucosamine. Glucosamine was as safe as placebo. {When compared to the previous review, this review which analyzes newer studies and more high quality studies, shows there is "platinum" level evidence that pain does not improve as much when taking glucosamine for 2 to 3 months. Depending on the scale used to measure function (physical ability), function may not improve at all or as much.

Glucosamine seems to be safe}

Moore RA, Wiffen PJ, Derry S, et al. **Gabapentin for chronic neuropathic pain and fibromyalgia** in adults. Cochrane Database Syst Rev. 2011 Mar 16;3:CD007938. Gabapentin provides pain relief of a high level in about a third of people who take if for painful neuropathic pain. Adverse events are frequent, but mostly tolerable. More conservative estimates of efficacy resulted from using better definitions of efficacy outcome at higher, clinically important, levels, combined with a considerable increase in the numbers of studies and participants available for analysis.

HäuserW, Urrútia G, Tort S, ÜçeylerN,Walitt B. Serotonin and noradrenaline reuptake inhibitors (SNRIs) for fibromyalgia syndrome. Cochrane Database of Systematic Reviews 2013, Issue 1. Art. No.: CD010292. DOI: 10.1002/14651858.CD010292. The SNRIs duloxetine and milnacipran provided a small incremental benefit over placebo in reducing pain.The superiority of duloxetine and milnacipran over placebo in reducing fatigue and limitations of QOL was not substantial. Duloxetine and milnacipran were not superior to placebo in reducing sleep problems. The dropout rates due to adverse events were higher for duloxetine and milnacipran than for placebo. The most frequently reported symptoms leading to stopping medication were nausea, dry mouth, constipation, headache, somnolence/dizziness and insomnia. Rare complications of both drugs may include suicidality, liver damage, abnormal bleeding, elevated blood pressure and urinary hesitation.

Topiramate is without evidence of efficacy in diabetic neuropathic pain, the only neuropathic condition in which it has been adequately tested.

Fitzcharles MA, Ste-Marie PA, Pereira JX; Canadian Fibromyalgia Guidelines Committee. Fibromyalgia: evolving concepts over the past 2 decades. CMAJ. 2013 Sep 17;185(13):E645-51.

Uceyler N, Sommer C, Walitt B, et al. **Anticonvulsants for fibromyalgia**. Cochrane Database Syst Rev. 2013 Oct 16;10:CD010782. The anticonvulsant, pregabalin, demonstrated a small benefit over placebo in reducing pain and sleep problems. Pregabalin use was shown not to substantially reduce fatigue compared with placebo. Study dropout rates due to adverse events were higher with pregabalin use compared with placebo. Dizziness was a particularly frequent adverse event seen with pregabalin use.

Lunn MP, Hughes RA, Wiffen PJ. **Duloxetine** for treating painful neuropathy, chronic pain or fibromyalgia. Cochrane Database Syst Rev. 2014 Jan 3;1:CD007115. There is adequate amounts of moderate quality evidence from eight studies performed by the manufacturers of duloxetine that doses of 60 mg and 120 mg daily are efficacious for treating pain in diabetic peripheral neuropathy but lower daily doses are not. Further trials are not required. In fibromyalgia, there is lower quality evidence that duloxetine is effective at similar doses to those used in diabetic peripheral neuropathy and with a similar magnitude of effect. The effect in fibromyalgia may be achieved through a greater improvement in mental symptoms than in somatic physical pain. There is low to moderate quality evidence that pain relief is also achieved in pain associated with depressive symptoms, but the NNTB of 8 in fibromyalgia and depression is not an indication of substantial efficacy.

Moore RA, Wiffen PJ, Derry S, et al. Gabapentin for chronic neuropathic pain and fibromyalgia in adults. Cochrane Database Syst Rev. 2014 Apr 27;4:CD007938. There was no top tier evidence that was unequivocally unbiased. Second tier evidence, with potentially important residual biases, showed that gabapentin at doses of 1200 mg or more was effective for some people with some painful neuropathic pain conditions. The outcome of at least 50% pain intensity reduction is regarded as a useful outcome of treatment by patients, and the achievement of this degree of pain relief is associated with important beneficial effects on sleep interference, fatigue, and depression, as well as quality of life, function, and work. About 35% achieved this degree of pain relief with gabapentin, compared with 21% for placebo.

Cheong YC, Smotra G, Williams AC. **Non-surgical** interventions for the management of **chronic pelvic pain**. Cochrane Database Syst Rev. 2014 Mar 5;3:CD008797.

Clegg DO, et al. Glucosamine, chondroitin sulfate, and the two in combination for painful knee osteoarthritis. N Engl J Med. 2006 Feb 23;354(8):795-808. InfoPOEMs: 03May2006. **Glucosamine** HCl and **chondroitin** provides modest if any symptomatic benefit for patients with mild osteoarthritis of the knee. This study was well designed and avoided many of the design flaws of earlier studies. However, it had a high dropout rate (20%) and used a different glucosamine salt than most previous studies. In addition, post-hoc analysis suggests a large benefit in patients with moderate to severe pain. There were also consistent trends toward benefit for many secondary outcomes. (LOE = 1b)

Carville SF, Arendt-Nielsen S, Bliddal H, et al. **EULAR** evidence-based recommendations for the management of fibromyalgia syndrome. Ann Rheum Dis 2008;7:536-541. {InfoPOEMs: Antidepressants, pramipexole (Mirapex and Sifrol), pregabalin (Lyrica), tramadol (Ultram), tropisetron (Navoban), and heated pool treatments have been shown to have short-term effectiveness in the treatment of fibromyalgia pain. (LOE = 1a-)}

Derry CJ, Derry S, Moore RA. **Caffeine** as an analgesic adjuvant for acute pain in adults. Cochrane Database of Systematic Reviews 2012, Issue 3. Art. No.: CD009281. DOI: 10.1002/14651858.CD009281.pub2. The addition of caffeine (≥100 mg) to a standard dose of commonly used analgesics provides a small but important increase in the proportion of participants who experience a good level of pain relief.

Derry S, Moore RA. **Topical capsaicin** (low concentration) for chronic neuropathic pain in adults. Cochrane Database Syst Rev. 2012 Sep 12;9:CD010111. There were insufficient data to draw any conclusions about the efficacy of low-concentration capsaicin cream in the treatment of neuropathic pain.

Derry S, Derry CJ, Moore RA. Single dose oral **ibuprofen plus oxycodone** for acute postoperative pain in adults. Cochrane Database Syst Rev. 2013 Jun 26;6:CD010289. doi: 10.1002/14651858.CD010289.pub2. The combination of ibuprofen 400mg + oxycodone 5mg provided analgesia for longer than oxycodone alone, but not ibuprofen alone (at the same dose). There was also a smaller chance of needing additional analgesia over about eight hours, and with no greater chance of experiencing an adverse event.

HäuserW, Urrútia G, Tort S, ÜçeylerN,Walitt B. Serotonin and noradrenaline reuptake inhibitors (**SNRIs**) for **fibromyalgia** syndrome. Cochrane Database of Systematic Reviews 2013, Issue 1. Art. No.: CD010292. DOI: 10.1002/14651858.CD010292. The SNRIs duloxetine and milnacipran provided a small incremental benefit over placebo in reducing pain.The superiority of duloxetine and milnacipran over placebo in reducing fatigue and limitations of QOL was not substantial. Duloxetine and milnacipran were not superior to placebo in reducing sleep problems. The dropout rates due to adverse events were higher for duloxetine and milnacipran than for placebo. The most frequently reported symptoms leading to stopping medication were nausea, dry mouth, constipation, headache, somnolence/dizziness and insomnia. Rare complications of both drugs may include suicidality, liver damage, abnormal bleeding, elevated blood pressure and urinary hesitation.

McNicol ED, Midbari A, Eisenberg E. **Opioids for neuropathic pain**. Cochrane Database Syst Rev. 2013 Aug 29;8:CD006146. doi: 10.1002/14651858.CD006146.pub2. Since the last version of this review, new studies were found providing additional information. Data were reanalyzed but the results did not alter any of our previously published conclusions. Short-term studies provide only equivocal evidence regarding the efficacy of opioids in reducing the intensity of neuropathic pain. Intermediate-term studies demonstrated significant efficacy of opioids over placebo, but these results are likely to be subject to significant bias because of small size, short duration, and potentially inadequate handling of dropouts. Analgesic efficacy of opioids in chronic neuropathic pain is subject to considerable uncertainty. Reported adverse events of opioids were common but not life-threatening.

Medical Letter: Treatment guidelines. **Drugs for Pain**. April 2007; April 2010. **April 2013,**

Molsberger AF, Schneider T, Gotthardt H, Drabik A. German Randomized **Acupuncture** Trial for chronic shoulder pain (**GRASP**) - a pragmatic, controlled, patient-blinded, multi-centre trial in an outpatient care environment. Pain. 2010 Oct;151(1):146-54.

Moon DE, Lee DI, Lee SC, et al. Efficacy and tolerability of **pregabalin** using a flexible, optimized dose schedule in Korean patients with peripheral neuropathic pain: a 10-week, randomized, double-blind, placebo-controlled, multicenter study. Clin Ther. 2010 Dec;32(14):2370-85.

Moore RA, Straube S, et al. **Pregabalin** for **acute and chronic pain** in adults. Cochrane Database Syst Rev. 2009 Jul 8;(3):CD007076. Pregabalin has proven efficacy in neuropathic pain conditions and fibromyalgia. A minority of patients will have substantial benefit with pregabalin, and more will have moderate benefit. Many will have no or trivial benefit, or will discontinue because of adverse events. Individualisation of treatment is needed to maximise pain relief and minimise adverse events. There is no evidence to support the use of pregabalin in acute pain scenarios.

Moore RA, Wiffen PJ, Derry S, et al. **Gabapentin for chronic neuropathic pain and fibromyalgia** in adults. Cochrane Database Syst Rev. 2011 Mar 16;3:CD007938. Gabapentin provides pain relief of a high level in about a third of people who take if for painful neuropathic pain. Adverse events are frequent, but mostly tolerable. More conservative estimates of efficacy resulted from using better definitions of efficacy outcome at higher, clinically important, levels, combined with a considerable increase in the numbers of studies and participants available for analysis.

Moore RA, Derry S, Aldington D, et al. **Amitriptyline for neuropathic pain and fibromyalgia** in adults. Cochrane Database Syst Rev. 2012 Dec 12;12:CD008242. doi: 10.1002/14651858.CD008242.pub2. Amitriptyline has been a first-line treatment for neuropathic pain for many years. The fact that there is no supportive unbiased evidence for a beneficial effect is disappointing, but has to be balanced against decades of successful treatment in many patients with neuropathic pain or fibromyalgia.

Febuxostat for the management of hyperuricaemia in people with gout. NICE Dec 2008 Guidance http://www.nice.org.uk/TA164

Schumacher HR Jr, Becker MA, Wortmann RL, et al. Effects of febuxostat versus allopurinol and placebo in reducing serum urate in subjects with hyperuricemia and gout: a 28-week, phase III, randomized, double-blind, parallel-group trial. Arthritis Rheum. 2008 Nov 15;59(11):1540-8. Significantly (P < or = 0.05) higher percentages of subjects treated with febuxostat 80 mg (48%), 120 mg (65%), and 240 mg (69%) attained the primary end point of last 3 monthly serum urate levels <6.0 mg/dl compared with allopurinol (22%) and placebo (0%). At all doses studied, febuxostat more effectively lowered and maintained serum urate levels <6.0 mg/dl than did allopurinol (300 or 100 mg) or placebo in subjects with hyperuricemia and gout, including those with mild to moderately impaired renal Function.

Gelber AC. Febuxostat versus allopurinol for gout. N Engl J Med. 2006 Apr 6;354(14):1532-3; author reply 1532-3.

29 Hare JM, Mangal B, Brown J, ; OPT-CHF Investigators. Impact of oxypurinol in patients with symptomatic heart failure. Results of the OPT-CHF study. J Am Coll Cardiol. 2008 Jun 17;51(24):2301-9. Oxypurinol did not produce clinical improvements in unselected patients with moderate-to-severe heart failure. However, post-hoc analysis suggests that benefits occur in patients with elevated SUA in a manner correlating with the degree of SUA reduction. Serum uric acid may serve as a valuable biomarker to target XO inhibition in heart failure.

Reinders MK, van Roon EN, et al. Efficacy and tolerability of urate lowering drugs in gout: a randomised controlled trial of benzbromarone versus probenecid after failure of allopurinol. Ann Rheum Dis. 2008 Apr 23. [Epub ahead of print] This study demonstrates a poor efficacy and tolerability profile of allopurinol 300 mg/day to attain a biochemical predefined target level of sUr </=0.30 mmol/l after 2-months treatment. In stage 2, benzbromarone 200 mg/day is more effective and better tolerated than probenecid 2000mg/day.

Reinders MK, Haagsma C, et al.. A randomised controlled trial on the efficacy and tolerability with dose-escalation of allopurinol 300-600 mg/day versus benzbromarone 100-200 mg/day in patients with gout. Ann Rheum Dis. 2008 Jul 16. [Epub ahead of print] Increase of allopurinol dosage from 300 mg to 600 mg/day and benzbromarone dosage from 100 mg to 200 mg/day according to target sUr, gives significantly higher success rates (both 78% success in sUr </=0.30 mmol/l). No significant differences in treatment success between benzbromarone and allopurinol groups were found after dosage escalation combination in relieving pain but is associated with fewer adverse effects.

Consider limiting dose to ≤3250mg/day if elderly or chronic use, or ≤2600mg/day if hepatic/renal disease or chronic alcohol use. **Pediatrics:** 10-15mg/kg q4-6hr; **Max**: 75mg/kg/day	$20 $25	**NON-ANTI-INFLAMMATORY ANALGESIC** • Compared to NSAIDs/COXIBs, lowest risk for CV events & GI ulcer/bleed • Option in osteoarthritis • **D**: warfarin ↑ INR with scheduled chronic use of acetaminophen • **M**: **LFTs** with chronic use & if ↑ alcohol use [Larson'05] • **Acute Overdose: hepatotoxic** (#1 cause of drug-induced transplant) >140mg/kg or >7.5g - Level within 24 hours predictive [Rumack-Matthew Nomogram 36]

Combination Product to Reduce Dyspepsia: ASPIRIN STOMACH GUARD: ASA 325/500mg & Ca^{++} Carbonate 227.5/350mg **OTC** ✘ ⊗

New Drugs/Formulations:

◆ low-dose **diclofenac submicron** particles (ZORVOLEX) [Not in Canada] – 18, 35mg capsules. Reduction in particle size ↑'s surface area resulting in faster dissolution & absorption.

Discontinued Products:

NSAIDs: Choline Mg^{++} Trisalicylate TRILISATE, Fenoprofen NALFON, Piroxicam BREXIDOL, Salsalate DISALCID, Tolmentin TOLECTIN.

COX-2 Inhibitors:

- Lumiracoxib PREXIGE 100mg daily. Discontinued October 2007. Rare severe hepatic toxicity at doses ≥200mg/day.
- Rofecoxib VIOXX 12.5mg (OA) to 25mg (OA/RA) daily. Discontinued September 2004. VIGOR: CV events NNH=83, GI NNT=129/8 months.
- Valdecoxib BEXTRA 10-20mg daily (OA, RA). Discontinued April 2005 in Canada, USA. Rare severe skin reactions e.g. exfoliative dermatitis & Stevens Johnson Syndrome.

Trials to watch:

- PRECISION: CV risk of celecoxib vs ibuprofen vs naproxen (estimated study completion date - Sept 2015) http://clinicaltrials.gov/ct/show/NCT00346216?order=4

[20] Bresalier RS, et al. Cardiovascular Events Associated with Rofecoxib in a Colorectal Adenoma Chemoprevention Trial (**APPROVe**). *N Engl J Med 2005; 352:1092-102.* (InfoPOEMs: For every 62 patients who take rofecoxib instead of placebo for 3 years, 1 additional patient will experience a serious cardiovascular event. Remember, there is no greater symptomatic relief with COX-2 inhibitors than with older drugs; acetaminophen is a very safe alternative. The decrease in risk of serious gastrointestinal complications is marginal with COX-2 inhibitors and the cost is high. (LOE = 1b))

[21] Solomon SD, McMurray JJ, Pfeffer MA, et al. Cardiovascular Risk Associated with Celecoxib in a Clinical Trial for Colorectal Adenoma Prevention. (**APC** trial) N Engl J Med 2005; 352:1071-80. (InfoPOEMs: One additional cardiovascular event or cardiovascular death occurs for every 126 patients treated for 1 year with celecoxib. There appears to be a dose response relationship. It is difficult to justify continued use of this and other coxibs, except in the most exceptional circumstances. (LOE = 1b)) (Bertagnolli MM, Eagle CJ, Zauber AG, et al. Celecoxib for the prevention of sporadic colorectal adenomas. (APC study) N Engl J Med 2006; 355:873-884. Follow-up colonoscopies were completed at year 1 in 89.5 percent of randomized patients, and at year 3 in 75.7 percent. The estimated cumulative incidence of the detection of one or more adenomas by year 3 was 60.7 percent for patients receiving placebo, as compared with 43.2 percent for those receiving 200 mg of celecoxib twice a day (risk ratio, 0.67; 95 percent confidence interval, 0.59 to 0.77; P<0.001) and 37.5 percent for those receiving 400 mg of celecoxib twice a day (risk ratio, 0.55; 95 percent confidence interval, 0.48 to 0.64; P<0.001). Serious adverse events occurred in 18.8 percent of patients in the placebo group, as compared with 20.4 percent of those in the low-dose celecoxib group (risk ratio, 1.1; 95 percent confidence interval, 0.9 to 1.3; P=0.5) and 23.0 percent of those in the high-dose group (risk ratio, 1.2; 95 percent confidence interval, 1.0 to 1.5; P=0.06). As compared with placebo, celecoxib was associated with an increased risk of cardiovascular events (risk ratio for the low dose, 2.6; 95 percent confidence interval, 1.1 to 6.1; and risk ratio for the high dose, 3.4; 95 percent confidence interval, 1.5 to 7.9).) (Arber N, Eagle CJ, Spicak J, et al. Celecoxib for the prevention of colorectal adenomatous polyps. (PreSAP trial) N Engl J Med 2006; 355:885-895. Colonoscopies were performed at year 1 on 88.7 percent of the subjects who had undergone randomization and at year 3 on 79.2 percent. Of the 557 subjects in the placebo group and the 840 subjects in the celecoxib 400mg od group who were included in the efficacy analysis, 264 and 270, respectively, were found to have at least one adenoma at year 1, at year 3, or both. The cumulative rate of adenomas detected through year 3 was 33.6 percent in the celecoxib group and 49.3 percent in the placebo group (relative risk, 0.64; 95 percent confidence interval, 0.56 to 0.75; P<0.001). The cumulative rate of advanced adenomas detected through year 3 was 5.3 percent in the celecoxib group and 10.4 percent in the placebo group (relative risk, 0.49; 95 percent confidence interval, 0.33 to 0.73; P<0.001). Adjudicated serious cardiovascular events occurred in 2.5 percent of subjects in the celecoxib group and 1.9 percent of those in the placebo group (relative risk, 1.30; 95 percent confidence interval, 0.65 to 2.62). (Kerr DJ, Dunn JA, Langman MJ, Smith JL, Midgley RS, Stanley A, Stokes JC, Julier P, Iveson C, Duvvuri R, McConkey CC; VICTOR Trial Group. Rofecoxib and cardiovascular adverse events in adjuvant treatment of colorectal cancer. N Engl J Med. 2007 Jul 26;357(4):360-9. Rofecoxib therapy was associated with an increased frequency of adverse cardiovascular events among patients with a median study treatment of 7.4 months' duration.)

[22] Farkouh ME, Kirshner H., Harrington RA. Comparison of lumiracoxib with naproxen and ibuprofen in the Therapeutic Arthritis Research and Gastrointestinal Event Trial (**TARGET**), cardiovascular outcomes: randomised controlled trial. Lancet 2004;364:675-84. At 1-year follow-up, incidence of the primary endpoint was low, both with lumiracoxib (59 events [0.65%]) and the non-steroidal anti-inflammatory drugs (50 events [0.55%]; hazard ratio 1.14 [95% CI 0.78-1.66], p=0.5074). Incidence of myocardial infarction (clinical and silent) in the overall population in the individual substudies was 0.38% with lumiracoxib (18 events) versus 0.21% with naproxen (ten) and 0.11% with lumiracoxib (five) versus 0.16% with ibuprofen (seven).

[23] Schnitzer TJ., Burmester GR., Mysler E., Comparison of lumiracoxib with naproxen and ibuprofen in the Therapeutic Arthritis Research and Gastrointestinal Event Trial (**TARGET**), reduction in ulcer complications: randomised controlled trial. Lancet 2004;364:665-74. (18325 patients age 50 years or older with osteoarthritis were randomised to lumiracoxib 400 mg once daily (n=9156), naproxen 500 mg twice daily (4754), or ibuprofen 800 mg three times daily (4415) in two substudies of identical design. Randomisation was stratified for low-dose aspirin use and age. In patients not taking aspirin, the cumulative 1-year incidence of ulcer complications was 1.09% (95% CI 0.82-1.36) with non-steroidal anti-inflammatory drugs (64 events) versus 0.25% (95% CI 0.12-0.39) with lumiracoxib (14 events; hazard ratio 0.21 [95% CI 0.12-0.37], p<0.0001). Reductions in ulcer complications were also significant in the overall population (0.34 [0.22-0.52], p<0.0001) but not in those taking aspirin (0.79 [0.40-1.55], p=0.4876). In the overall population, 0.55% (50/9127) of those on non-steroidal anti-inflammatory drugs and 0.65% (59/9117) of those on lumiracoxib reached the cardiovascular endpoint (1.14 [0.78-1.66], p=0.5074).) (see also Pharmacists Letter Dec/06) Hawkey CJ et al. Effect of risk factors on complicated and uncomplicated ulcers in the TARGET lumiracoxib outcomes study. Gastroenterology 2007 Jul; 133:57-64. Lumiracoxib was associated with a reduced risk of ulcer complications compared with NSAIDs in all significant subgroups except aspirin users.

Long-term use of NSAIDs is associated with a reduced incidence of oral cancer (including in active smokers), but also with an increased risk of death due to cardiovascular disease. These findings highlight the need for a careful risk-benefit analysis when the long-term use of NSAIDs. (Jan/06 The Norwegian daily newspaper Dagbladet reports that a number of **statistical improbabilities** were found in the data set of the cancer trial, published in the Lancet in October last year. Lancet editor Dr Richard Horton told the BBC he would be speaking to the coauthors of the study to seek their permission to retract the paper. One example of the improbabilities" is the fact that of the 908 people in the trial, 250 shared the same birthday.)

Amin SB, Sinkin RA, Glantz JC. Metaanalysis of the effect of antenatal **indomethacin** on **neonatal outcomes**. Am J Obstet Gynecol. 2007 Nov;197(5):486.e1-10. Antenatal indomethacin may be associated with an increased risk of periventricular leukomalacia and necrotizing enterocolitis in premature infants and therefore should be used judiciously for tocolysis.

Ananthakrishnan AN, Higuchi LM, Huang ES, et al. Aspirin, Nonsteroidal Anti-inflammatory Drug Use, and **Risk for Crohn Disease and Ulcerative Colitis**: A Cohort Study (NHS). Ann Intern Med. 2012 Mar 6;156(5):350-9.

Andersohn F, et al. Cyclooxygenase-2 Selective Nonsteroidal Anti-Inflammatory Drugs and the **Risk of Ischemic Stroke**. A Nested Case-Control Study. Stroke. 2006 May 25; [Epub ahead of print] Current use of rofecoxib (OR=1.71; 95% CI, 1.33 to 2.18), etoricoxib (OR=2.38; 95% CI, 1.10 to 5.13), but not of celecoxib (OR=1.07; 95% CI, 0.79 to 1.44) was associated with a significantly increased risk of ischemic stroke. For rofecoxib and etoricoxib, ORs tended to increase with higher daily dose and longer duration of use and were also elevated in patients without major stroke risk factors. "From the non-selective NSAIDs, diclofenac, but not ibuprofen or naproxen, was also associated with a slightly increased risk of ischemic stroke," Dr. Andersohn said.

Andersohn F, Suissa S, Garbe E. Use of first- and second-generation cyclooxygenase-2-selective nonsteroidal antiinflammatory drugs & risk of **acute myocardial infarction**. Circulation. 2006 Apr 25;113(16):1950-7. Epub 2006 Apr 17. Current use of etoricoxib was associated with a 2.09-fold (95% confidence interval [CI], 1.10 to 3.97) risk of AMI compared with no use of NSAIDs during the prior year. Current use of rofecoxib (RR=1.29; 95% CI, 1.02 to 1.63), celecoxib (RR=1.56; 95% CI, 1.22 to 2.00), and diclofenac (RR=1.37; 95% CI, 1.17 to 1.59) also significantly increased the AMI risk. For current use of valdecoxib, the RR was 4.60 (95% CI, 0.61 to 34.51). RRs appeared to increase with higher daily doses of COX-2 inhibitors and were also increased in patients without major cardiovascular risk factors.

Andrew T. Chan, MD, MPH; Edward L. et al. Long-term Use of Aspirin and Nonsteroidal Anti-inflammatory Drugs and Risk of Colorectal Cancer JAMA. 2005;294:914-923. CONCLUSIONS: Regular, long-term aspirin use reduces risk of colorectal cancer. Nonaspirin NSAIDs appear to have a similar effect. However, a significant benefit of aspirin is not apparent until more than a decade of use, with maximal risk reduction at doses greater than 14 tablets per week. These results suggest that optimal chemoprevention for colorectal cancer requires long-term use of aspirin doses substantially higher than those recommended for prevention of cardiovascular disease, but the dose-related risk of gastrointestinal bleeding must also be considered. (InfoPOEMs: Regular use of aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs), especially more than 14 doses per week for at least 10 years, reduces the risk of colon cancer while also increasing the risk of a major gastrointestinal bleeding event. All-cause mortality is not affected by regular use. We need additional methods (gene testing?) to determine who is at high risk of colorectal cancer before making specific recommendations for prevention. (LOE = 2b))

Chan AT, Ogino S, Fuchs CS. Aspirin use and survival after diagnosis of **colorectal cancer**. JAMA. 2009 Aug 12;302(6):649-58. Regular aspirin use after the diagnosis of colorectal cancer is associated with lower risk of colorectal cancer-specific and overall mortality, especially among individuals with tumors that overexpress COX-2.

Chan FKL, et al Clopidogrel versus **Aspirin and Esomeprazole** to Prevent Recurrent Ulcer Bleeding. N Engl J Med 2005;352:238-44. (InfoPOEMs: For patients with a history of bleeding peptic ulcer, the combination of aspirin and a proton pump inhibitor twice a day was safer in terms of bleeding side effects than clopidogrel. While esomeprazole was used in this study, generic omeprazole 20 mg give twice a day provides nearly the same degree of acid suppression at a much lower cost. This study calls into question the overall safety of clopidogrel, which has been promoted as not increasing the risk of bleeding significantly. (LOE = 1b))

Chan FK, et al. Preventing recurrent upper gastrointestinal bleeding in patients with Helicobacter pylori infection who are taking low-dose aspirin or naproxen. N Engl J Med. 2001 Mar 29;344(13):967-73. CONCLUSIONS: Among patients with H. pylori infection and a history of upper gastrointestinal bleeding who are taking low-dose aspirin, the eradication of H. pylori is equivalent to treatment with omeprazole in preventing recurrent bleeding. Omeprazole is superior to the eradication of H. pylori in preventing recurrent bleeding in patients who are taking other NSAIDs.

Chan FK, Wong VW, Suen BY, et al. Combination of cyclo-oxygenase-2 inhibitor **(celecoxib 200mg bid) and proton-pump inhibitor (esomeprazole 20mg bid)** for prevention of recurrent ulcer bleeding in patients at very high risk: a double-blind, randomised trial. Lancet. 2007 May 12;369(9573):1621-6. The 13-month cumulative incidence of the primary endpoint was 0% in the combined-treatment group and 12 (8.9%) in the controls (95% CI difference, 4.1 to 13.7; p=0.0004). n=441 12months. Patients at very high risk for recurrent ulcer bleeding who need anti-inflammatory analgesics should receive combination treatment with a COX 2 inhibitor and a PPI. Our findings should encourage guideline committees to review their recommendations for patients at very high risk of recurrent ulcer bleeding.

Chan CC, Reid CM, Aw TJ, Liew D, Haas SJ, Krum H. Do COX-2 inhibitors raise blood pressure more than nonselective NSAIDs and placebo? An updated meta-analysis. J Hypertens. 2009 Nov 2. [Epub ahead of print] However, this response was heterogeneous, with markedly raised BP associated with rofecoxib and etoricoxib, whereas celecoxib, valdecoxib and lumiracoxib appeared to have little BP effect.

Derry S, Moore RA. Single dose oral **aspirin for acute postoperative pain** in adults. Cochrane Database Syst Rev. 2012 Apr 18;4:CD002067. Aspirin is an effective analgesic for acute pain of moderate to severe intensity. High doses are more effective, but are associated with increased adverse events, including drowsiness and gastric irritation. The pain relief achieved with aspirin was very similar milligram for milligram to that seen with paracetamol.

Derry S, Moore RA, Rabbie R. Topical NSAIDs for chronic musculoskeletal pain in adults. Cochrane Database of Systematic Reviews 2012, Issue 9. Art. No.: CD007400. DOI: 10.1002/14651858.CD007400.pub2. Topical NSAIDs can provide good levels of pain relief; topical diclofenac solution is equivalent to that of oral NSAIDs in knee and hand osteoarthritis, but there is no evidence for other chronic painful conditions. Formulation can influence efficacy. The incidence of local adverse events is increased with topical NSAIDs, but gastrointestinal adverse events are reduced compared with oral NSAIDs.

Derry S, Derry CJ, Moore RA. Single dose oral **ibuprofen plus oxycodone** for acute postoperative pain in adults. Cochrane Database Syst Rev. 2013 Jun 26;6:CD010289. The combination of ibuprofen 400mg + oxycodone 5mg provided analgesia for longer than oxycodone alone, but not ibuprofen alone (at the same dose). There was also a smaller chance of needing additional analgesia over about eight hours, and with no greater chance of experiencing an adverse event.

FDA- **Acetaminophen and Liver Injury**: Q & A for Consumers 2009 http://www.fda.gov/downloads/ForConsumers/ConsumerUpdates/UCM172664.pdf

FDA Dec/09 , Endo, & Novartis revised the Hepatic Effects section of the Prescribing Information to add new warnings and precautions about the potential for elevation in liver function tests during treatment with all products (**including diclofenac gel**) on **diclofenac** sodium. In postmarketing reports, cases of drug-induced **hepatotoxicity** have been reported in the first month but can occur at any time during treatment with diclofenac. Postmarketing surveillance has reported cases of severe hepatic reactions, including liver necrosis, jaundice, fulminant hepatitis with and without jaundice, and liver failure. Some of these reported cases resulted in fatalities or liver transplantation.

FDA June/12 cautioned late last week against using **Reumofan Plus**, a dietary supplement marketed as a "natural" pain reliever for arthritis, osteoporosis, and other conditions. The drug, which is made in Mexico but available online, contains unlabeled and potentially harmful pharmaceutical ingredients: diclofenac, methocarbamol & sometimes dexamethasone. (Dec/12 FDA: Reumofan Plus is being relabeled and sold under the name "**WOW**.")

FDA Aug/12 is issuing an updated alert that **Reumofan Plus and Reumofan Plus Premium** contain undeclared active ingredients found in prescription drugs that should be used only under the supervision of a health care professional. It contains Diclofenac Sodium and Methocarbamol.

FDA Aug/13 laboratory analysis confirmed that **Ortiga contains the prescription drug ingredient, diclofenac**.

FDA Jan/14 is recommending health care professionals **discontinue prescribing and dispensing prescription combination drug products that contain more than 325 milligrams (mg) of acetaminophen** per tablet, capsule or other dosage unit.

FDA Feb/14 analysis of **Arth-Q supplement** contains hidden ingredient ibuprofen.

FDA Mar/14: Pain Free By Nature is recalling "**Reumofan Plus**" Tablets purchased through their website at www.painfreebynature.com, after FDA discovered that the product was distributed in packaging that did not reveal the presence of the active pharmaceutical ingredients methocarbamol and **diclofenac**, making it an unapproved drug.

FDA Apr/14: Nano Well-being Health Inc. issued a voluntary recall of **Super Arthgold**, 500 mg capsules to the consumer level. FDA laboratory analysis has found the product to contain chlorzoxazone, diclofenac and indomethacin.

Felson DT. Clinical practice. **Osteoarthritis of the knee**. N Engl J Med. 2006 Feb 23;354(8):841-8.

Flossmann E, Rothwell PM; British Doctors Aspirin Trial and the UK-TIA Aspirin Trial. Effect of **aspirin on long-term risk of colorectal cancer**: consistent evidence from randomised and observational studies. Lancet. 2007 May 12;369(9573):1603-13. Use of 300 mg or more of aspirin a day for about 5 years is effective in primary prevention of colorectal cancer in randomised controlled trials, with a latency of about 10 years, which is consistent with findings from observational studies. Long-term follow-up is required from other randomised trials to establish the effects of lower or less frequent doses of aspirin.

Forman JP, Rimm EB, Curhan GC. Frequency of analgesic use and risk of hypertension among men. Arch Intern Med 2007; 167:394-399. The frequency of **nonnarcotic analgesic** use is independently associated with a moderate increase in the risk of incident **hypertension**. Given the widespread use of these medications and the high prevalence of hypertension, these results may have important public health implications.

Gaujoux-Viala C, Dougados M, Gossec L. Efficacy and safety of **steroid injections** for shoulder and elbow tendonitis: a meta-analysis of randomized controlled trials. Ann Rheum Dis. 2009 Dec;68(12):1843-9. Epub 2008 Dec 3. In the first 3 months of tendinitis of either the elbow or shoulder, injected corticosteroids are more effective than placebo or physical therapy, but no more effective than treatment with nonsteroidal anti-inflammatory drugs (NSAIDs). In the longer term they are no more effective than any treatment. What hasn't been studied is the effectiveness of steroid injections in patients for whom NSAID treatment isn't effective, since this is the usual progression of treatment of these painful conditions. (LOE = 1a-)

Gislason GH, et al. **Risk of Death or Reinfarction** Associated With the Use of Selective Cyclooxygenase-2 Inhibitors and Nonselective Nonsteroidal Antiinflammatory Drugs After Acute Myocardial Infarction. Circulation. 2006 Jun 19; [Epub ahead of print] For any use of rofecoxib, celecoxib, ibuprofen, diclofenac, and other NSAIDs, the hazard ratios and 95% confidence intervals for death were 2.80 (2.41 to 3.25; for rofecoxib), 2.57 (2.15 to 3.08; for celecoxib), 1.50 (1.36 to 1.67; for ibuprofen), 2.40 (2.09 to 2.80; for diclofenac), and 1.29 (1.16 to 1.43; for other NSAIDS); there were dose-related increases in risk of death for all of the drugs. There were trends for increased risk of rehospitalization for MI associated with the use of both the selective COX-2 inhibitors and the nonselective NSAIDs. CONCLUSIONS: Selective COX-2 inhibitors in all dosages and nonselective NSAIDs in high dosages increase mortality in patients with previous MI and should therefore be used with particular caution in these patients.

Health Canada Prohits sale of Bextra http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/2005/2005_134_e.html

Health Canada June/06 two documents as part of its ongoing evaluation of COX-2-selective drugs: its official comments on the advice provided by the COX-2 Expert Advisory Panel and a report on the Department's scientific review of certain COX-2s. http://www.hc-sc.gc.ca/dhp-mps/prodpharma/activit/sci-consult/cox2/index_e.html

Health Canada Aug/07 reports that the Therapeutic Goods Administration (TGA), the federal regulatory authority in Australia, recently withdrew market authorization for **Prexige due to eight reports of serious liver adverse events** in Australia linked to the drug, including two deaths and two liver transplants. These adverse events were primarily with use of 200 mg and 400 mg doses daily.

Health Canada Sept/07 reports that **Qiangli Zhuanggutongbiling** has reportedly been used for joint pain and stiffness. It was found to contain the undeclared prescription drugs prednisolone acetate, cortisone acetate, piroxicam, and diclofenac.

Health Canada Sept/07: **Khun-Phra** is a health product promoted for pain relief that has been found to contain the undeclared drugs dexamethasone, prednisolone, phenylbutazone, diazepam, cyproheptadine and mebhydrolin.. **Asam Urat Flu Tulang, PJ Dewandaru** is a health product promoted to treat joint pain, rheumatism and arthritis. It has been found to contain the undeclared drugs dexamethasone, diclofenac and acetaminophen.

Health Canada Oct/07 Foreign Product Alerts: ***Zhen Feng Da Brand Xi Tong Wan*** is promoted as a pain reliever. Lot #060908 has been found to contain undeclared indomethacin, a prescription anti-inflammatory drug that should only be taken under the guidance of a health professional. ***Wellring Brand Yin Qiao Jie Du*** is a health product promoted to treat cold and flu symptoms. Lot#51005 has been found to contain undeclared acetaminophen. ***Gu Ci Dan*** and ***Xu Log Bou*** are promoted as pain relievers and have been found to contain indomethacin.

Health Canada Oct/07 is advising consumers that it has stopped the sale of the anti-inflammatory drug **Prexige** (lumiracoxib) in Canada and will cancel the drug's market authorization due to the potential for serious liver-related adverse events. (2 new severe cases in Canada)

Health Canada July/08 is advising consumers not to use 2 foreign health products due to concerns about possible side-effects: **3rd Generation In Homoeopathy Arthrit Indica Tablet**. The product is labelled for "intense joint pain." The Health Sciences Authority of Singapore has warned consumers not to use the product because it contains **nimesulide**, a pharmaceutical ingredient that has been associated with liver damage.

Health Canada Aug/08 is advising consumers not to use foreign health products due to concerns against the use of **AA Qu Feng Shu Jin Wan** because it was found to contain the undeclared pharmaceutical ingredient dexamethasone. **Obat Asam Urat** and **Asam Urat** both contained dexamethasone, phenylbutazone and piroxicam.

Health Canada June/09 is informing Canadian health care professionals and consumers of recent restrictions regarding the use of the prescription drug piroxicam. Health Canada has conducted a safety review and concluded that **piroxicam** should no longer be used to treat short-term pain and inflammation due to an increased risk of serious skin reactions and gastrointestinal problems relative to other similar drugs.

Health Canada July/09 is warning consumers not to use the unauthorized health product labelled as **Specific-Formula Arthro-Ace** as it was found to contain undeclared dexamethasone and may cause serious health effects.

Health Canada July/09 is warning that the Singapore Health Sciences Authority (HSA) warned consumers to not buy or use **Air Ikan Haruan** after it was found to contain undeclared dexamethasone. The Hong Kong Department of Health warned consumers not to buy or use the product **Neovidan** after it was found to contain undeclared prednisolone and mefenamic acid.

Health Canada Aug/09 is advising via Singapore Health Sciences Authority (HSA) that **Delima Raja Urat** contains undeclared dexamethasone, chlorpheniramine, pheniramine and sibutramine, while **Cao Gen Bai Lin Wan** contains undeclared dexamethasone and chlorpheniramine.

Health Canada Aug/10 **Huo Luo Jing Dan** The Singapore Health Sciences Authority warned consumers not to buy or consume Huo Luo Jing Dan after it was found to contain undeclared indomethacin, dexamethasone and prednisolone.

Health Canada Oct/11 **Huo Li Bao and Ren Sem Tu Chon Chin Kuo Pill** - The Singapore Health Sciences Authority warned that these Chinese pain-relief products contain prescription and/or over-the-counter drugs (furosemide, piroxicam, chlorpheniramine, and/or dexamethasone).

Health Canada Dec/11 is advising Canadians that Vita Health's product, "**Compliments Muscle and Back Pain Relief Regular Strength**" contains a significant labelling error in the French dosing directions that may pose serious risks to children (less than 12 years of age).

Health Canada Apr/13 **1. Diet Garcinia Forte; Shan Dian Shou; Aulura Energy Dietary Supplement** The Hong Kong Department of Health has advised consumers not to use these products after they were found to contain sibutramine and phenolphthalein, drug ingredients that were not declared on their product label. Shan Dian Shou also contains the undeclared prescription drug sildenafil. **2. Snake Powder Capsule for Rheumatism; Jia Rong Zhuang Gu Tong Bi Jiaonang; Long Ren Tang Fu She Gu Rang Jiao Nang** The Hong Kong Department of Health advised consumers not to use these products after they were found to contain multiple prescription and non-prescription drugs that were not declared on their product label. (prednisone, indomethacin, diclofenac, hydrochlorothiazide, cimetidine, prednisone, theophylline, dexamethasone etc). **3. Tinea Schwartz's; Tiao Jing Bu Xue Pills; Yeung Ng Tong Tin Hee Pills** The Hong Kong Department of Health advised consumers not to use these products after they were found to contain prescription drugs that were not declared on their product label (prednisone, indomethacin, diclofenac). **4. Quan Xie Jin Gu Tong; Xinhuang Pian; Jin Gu Feng Shi Kang Jiao Nang** The Hong Kong Department of Health advised consumers not to use these products after they were found to contain multiple prescription and non-prescription drugs that were not declared on their product label. (prednisone, piroxicam, diclofenac, indomethacin, naproxen).

Health Canada Apr/14: Nano Well-being Health Inc. issued a voluntary recall of **Super Arthgold**, 500 mg capsules to the consumer level. FDA laboratory analysis has found the product to contain chlorzoxazone, diclofenac and indomethacin, making it an unapproved new drug.

Health Canada May/14 **Ortiga** contains diclofenac.

Health Canada June/14: **Pro ArthMax** contains diclofenac, ibuprofen, naproxen, indomethacin, chlorzoxazone.

Hippisley-Cox J, Coupland C, Logan R. Risk of adverse gastrointestinal outcomes in patients taking **cyclo-oxygenase-2 inhibitors or conventional** non-steroidal anti-inflammatory drugs: population based nested case-control analysis. BMJ. 2005 Dec 3;331(7528):1310-6. CONCLUSION: No consistent evidence was found of enhanced safety against gastrointestinal events with any of the new cyclo-oxygenase-2 inhibitors compared with non-selective non-steroidal anti-inflammatory drugs. The use of ulcer healing drugs reduced the increased risk of adverse gastrointestinal outcomes with all groups of non-steroidal anti-inflammatory drugs, but for diclofenac the increased risk remained significant.

Ho JM, Juurlink DN. Considerations when prescribing **trimethoprim-sulfamethoxazole**. CMAJ. 2011 Oct 11. (NSAID DIs)

Hooper L, Brown TJ, Elliott R, et al. The effectiveness of **five strategies for the prevention of gastrointestinal toxicity** induced by non-steroidal anti-inflammatory drugs: systematic review. BMJ. 2004 Oct 23;329(7472):948. Epub 2004 Oct 8. CONCLUSIONS: Misoprostol, COX-2 specific and selective NSAIDs, and probably proton pump inhibitors significantly reduce the risk of symptomatic ulcers, and misoprostol and probably COX-2 specifics significantly reduce the risk of serious gastrointestinal complications, but data quality is low. More data on H2 receptor antagonists and proton pump inhibitors are needed, as is better reporting of rare but important outcomes.

Changes in rates of upper gastrointestinal hemorrhage after the introduction of **cyclooxygenase-2 inhibitors** in British Columbia and Ontario. CMAJ. 2006 Dec 5;175(12):1535-8. (InfoPOEMs: Although COX-2 inhibitors may be slightly less likely to cause gastrointestinal (GI) complications, the overall increase in the use of nonsteroidal anti-inflammatory drugs (NSAIDs) seen after their introduction appears to have led to an overall increase in the number of GI complications in the population (not to mention the thousands of cardiovascular deaths attributed to this class of drugs). Although physicians complain about prescribing restrictions, sometimes for good reason, in this case they seem to be of benefit. (LOE = 2c))

McGettigan P, Henry D. Cardiovascular Risk and Inhibition of Cyclooxygenase: A Systematic Review of the Observational Studies of Selective and Nonselective Inhibitors of Cyclooxygenase 2. JAMA. 2006 Sep 12; [Epub ahead of print] A dose-related risk was evident with rofecoxib, summary relative risk with 25 mg/d or less, 1.33 (95% confidence interval [CI], 1.00-1.79) and 2.19 (95% CI, 1.64-2.91) with more than 25 mg/d. The risk was elevated during the first month of treatment.

Celecoxib was not associated with an elevated risk of vascular occlusion, summary relative risk 1.06 (95% CI, 0.91-1.23). Among older nonselective drugs, diclofenac had the highest risk with a summary relative risk of 1.40 (95% CI, 1.16-1.70). The other drugs had summary relative risks close to 1: naproxen, 0.97 (95% CI, 0.87-1.07); piroxicam, 1.06 (95% CI, 0.70-1.59); and ibuprofen, 1.07 (95% CI, 0.97-1.18). CONCLUSIONS: This review confirms the findings from randomized trials regarding the risk of cardiovascular events with rofecoxib and suggests that celecoxib in commonly used doses may not increase the risk, contradicts claims of a protective effect of naproxen, and raises serious questions about the safety of diclofenac, an older drug. (InfoPOEMs: Rofecoxib (Vioxx), diclofenac (Voltaren, Cataflam), and indomethacin (Indocin) are associated with a significant increased risk of CVD. It is likely that all NSAIDs carry some risk, but the risks may vary between medicines. Current evidence does not point to an increased risk for low dose (over the counter) ibuprofen and this remains safe to use at recommended doses. (LOE = 2a-))

Rostom A, et al; U.S. Preventive Services Task Force. Nonsteroidal anti-inflammatory drugs and cyclooxygenase-2 inhibitors for **primary prevention of colorectal cancer**: a systematic review prepared for the U.S. Preventive Services Task Force. Ann Intern Med. 2007 Mar 6;146(5):376-89. Review. Summary for patients in: Ann Intern Med. 2007 Mar 6;146(5):I35. Cyclooxygenase-2 inhibitors and NSAIDs reduce the incidence of colonic adenomas. Nonsteroidal anti-inflammatory drugs also reduce the incidence of CRC. However, these agents are associated with important cardiovascular events and gastrointestinal harms. The balance of benefits to risk does not favor chemoprevention in average-risk individuals. (InfoPOEMs: The US Preventive Services Task Force recommends against routine use of aspirin or nonsteroidal anti-inflammatory drugs (NSAIDs) to prevent colorectal cancer. The beneficial decrease in colorectal adenoma, cancer incidence, and possibly cancer-related mortality is more than offset by the harm associated with their use. Ulcers leading to gastrointestinal bleeding, renal impairment, and an increase in cardiovascular events are the main problems. (LOE = 1a))

Scott PA, Kingsley GH, Smith CM, et al. Non-steroidal anti-inflammatory drugs and **myocardial infarctions**: comparative **systematic review** of evidence from observational studies and randomized controlled trials. Ann Rheum Dis. 2007 Oct;66(10):1296-304. Epub 2007 Mar 7. {The comparative risk of myocardial infarction (MI) with cyclo-oxygenase-2-specific drugs and traditional non-steroidal anti-inflammatory drugs (NSAIDs) was determined. METHODS: The results of studies of a suitable size in colonic adenoma and arthritis-that had been published in English and from which crude data about MIs could be extracted-were evaluated. Medline, Embase and Cinahl (2000-2006) databases, as well as published bibliographies, were used as data sources. Systematic reviews examined MI risks in case-control and cohort studies, as well as in randomised controlled trials (RCTs). RESULTS: 14 case-control studies (74 673 MI patients, 368 968 controls) showed no significant association of NSAIDs with MI in a random-effects model (OR 1.17; 95% CI 0.99 to 1.37) and a small risk of MI in a fixed-effects model (OR 1.32; 95% CI 1.29 to 1.35). Sensitivity analyses showed higher risks of MI in large European studies involving matched controls. Six cohort studies (387 983 patient years, 1 120 812 control years) showed no significant risk of MI with NSAIDs (RR 1.03; 95% CI 1.00 to 1.07); the risk was higher with rofecoxib (RR 1.25; 95% CI 1.17 to 1.34) but not with any other NSAIDs. Four RCTs of NSAIDs in colonic adenoma (6000 patients) showed an increased risk of MI (RR 2.68; 95% CI 1.43 to 5.01). Fourteen RCTs in arthritis (45 425 patients) showed more MIs with cyclo-oxygenase-2-specific drugs (Peto OR 1.6; 95% CI 1.1 to 2.4), but fewer serious upper gastrointestinal events (Peto OR 0.40; 95% CI 0.31 to 0.53). CONCLUSION: The overall risk of MI with NSAIDs and cyclo-oxygenase-2-specific drugs was small; rofecoxib showed the highest risk. There was an increased MI risk with cyclo-oxygenase-2-specific drugs compared with NSAIDs, but less serious upper gastrointestinal toxicity.}

Solomon SD, Wittes J, Finn PV, et al.; for the Cross Trial Safety Assessment Group. Cardiovascular Risk of Celecoxib in 6 Randomized Placebo-Controlled Trials. The Cross Trial Safety Analysis. Circulation. 2008 Mar 31; [Epub ahead of print] We observed evidence of differential cardiovascular risk as a function of celecoxib dose regimen and baseline cardiovascular risk. By further clarifying the extent of celecoxib-related cardiovascular risk, these findings may help guide treatment decisions for patients who derive clinical benefit from selective cyclooxygenase-2 inhibition. The risk, which increased with dose regimen (P=0.0005), was lowest for the 400-mg-QD dose (hazard ratio, 1.1; 95% CI, 0.6 to 2.0), intermediate for the 200-mg-BID dose (hazard ratio, 1.8; 95% CI, 1.1 to 3.1), and highest for the 400-mg-BID dose (hazard ratio, 3.1; 95% CI, 1.5 to 6.1).

Solomon Daniel H.; Rassen Jeremy A.; Glynn Robert J.; et al. The Comparative Safety of **Analgesics in Older Adults With Arthritis**. Arch Intern Med. 2010;170(22):1968-1978. The comparative safety of analgesics varies depending on the safety event studied. Opioid use exhibits an increased relative risk of many safety events compared with nsNSAIDs.

Strand V. Are COX-2 inhibitors preferable to non-selective non-steroidal anti-inflammatory drugs in patients with risk of cardiovascular events taking low-dose aspirin? Lancet 2007; 370:2138-2151. Mortality associated with gastrointestinal events is less frequent than with cardiovascular events, but asymptomatic ulcers can result in severe complications. Data support the conclusion that COX-2 inhibitors are preferable to non-selective NSAIDs in patients with chronic pain and cardiovascular risk needing low-dose aspirin, but relative risks and benefits should be assessed individually for each patient.

Witt CM, et al. **Acupuncture** in patients with osteoarthritis of the knee or hip: A randomized, controlled trial with an additional nonrandomized arm. Arthritis Rheum. 2006 Oct 30;54(11):3485-3493. These results indicate that acupuncture plus routine care is associated with marked clinical improvement in patients with chronic OA-associated pain of the knee or hip.

Wong T, Stang AS, Ganshorn H, Hartling L, Maconochie IK, Thomsen AM, Johnson DW. **Combined and alternating paracetamol and ibuprofen** therapy for febrile children. Cochrane Database of Systematic Reviews 2013, Issue 10. Art. No.: CD009572. DOI: 10.1002/14651858.CD009572.pub2. There is some evidence that both alternating and combined antipyretic therapy may be more effective at reducing temperatures than monotherapy alone.However, the evidence for improvements inmeasures of child discomfort remains inconclusive.

Yelland MJ, Nikles CJ, McNairn N, Del Mar CB, Schluter PJ, Brown RM. Celecoxib compared with sustained-release paracetamol for osteoarthritis: a series of n-of-1 trials. Rheumatology (Oxford). 2007 Jan;46(1):135-40. {InfoPOEMs – Feb07: In this short-term study emphasizing individual response, acetaminophen and celecoxib (Celebrex) are virtually indistinguishable in improving pain, stiffness, and function in patients with clinically diagnosed degenerative joint disease (DJD). Since acetaminophen is less expensive and has fewer safety concerns, it should be the drug of first choice. (LOE = 1b).}

Zapata-Colindres JC,et al. The association of Helicobacter pylori infection and nonsteroidal anti-inflammatory drugs in peptic ulcer disease. Can J Gastroenterol. 2006 Apr;20(4):277-80. The development of PUD was observed earlier in the combined H pylori and NSAID group than in patients with only NSAID use. This suggests a synergic effect between the two risks factors in the development of PUD.

[26] Mazieres B, Rouanet S, Guillon Y, Scarsi C, Reiner V. Topical ketoprofen patch in the treatment of tendinitis: a randomized, double blind, placebo controlled study. J Rheumatol. 2005 Aug;32(8):1563-70.

Underwood M, Ashby D, Cross P, et al; on behalf of the TOIB study team. Advice to use **topical or oral ibuprofen** for chronic knee pain in older people: randomised controlled trial & patient preference study. BMJ. 2007 Dec 4; [Epub ahead of print] Advice to use oral or topical preparations has an equivalent effect on knee pain over one year, and there are more minor side effects with oral NSAIDs. Topical NSAIDs may be a useful alternative to oral NSAIDs.

Massey T, Derry S, Moore RA, McQuay HJ. **Topical NSAIDs** for acute pain in adults. Cochrane Database Syst Rev. 2010 Jun 16;6:CD007402. Topical NSAIDs can provide good levels of pain relief, without the systemic adverse events associated with oral NSAIDs, when used to treat acute musculoskeletal conditions.

Derry S, Moore RA, Rabbie R. Topical NSAIDs for chronic musculoskeletal pain in adults. Cochrane Database of Systematic Reviews 2012, Issue 9. Art. No.: CD007400. DOI: 10.1002/14651858.CD007400.pub2. Topical NSAIDs can provide good levels of pain relief; topical diclofenac solution is equivalent to that of oral NSAIDs in knee and hand osteoarthritis, but there is no evidence for other chronic painful conditions. Formulation can influence efficacy. The incidence of local adverse events is increased with topical NSAIDs, but gastrointestinal adverse events are reduced compared with oral NSAIDs.

[27] Lin J, Zhang W, Jones A, Doherty M. Efficacy of topical non-steroidal anti-inflammatory drugs in the treatment of osteoarthritis: meta-analysis of randomised controlled trials. BMJ. 2004 Aug 7;329(7461):324. (Towheed TE. **Pennsaid** therapy for osteoarthritis of the knee: a systematic review and metaanalysis of randomized controlled trials. J Rheumatol. 2006 Mar;33(3):567-73.)

OPIOID ANALGESIC: COMPARISON CHART

Extras:

- Buprenorphine Transdermal System (BuTrans Patch) Q&A – Aug 2010: http://www.rxfiles.ca/rxfiles/uploads/documents/BuTrans-QandA.pdf
- Fentanyl Nasal Spray (LAZANDA): available in USA, for cancer related breakthrough pain; 100ug/100mcL, 400ug/100mcL; time to onset =11 minutes; always start at 100ug spray, allow 2 hrs between doses, stepwise ↑ in dosage, max 4 doses in 24hrs.
- Fentanyl Sublingual Tablet (PALADIN, ProStrakan in USA): 100, 200, 300, 400, 600, 800 ug.
- Hydrocodone + Ibuprofen (REPREXAIN, VICOPROFEN, others): available in USA. (5/200, 7.5/200, 10/200 mg)
- Methadone injection (IV): available via special access program (SAP) in Canada
- Morphine + naltrexone (EMBEDA): available in USA; naltrexone added to ↓ abuse risk.
- Oxycodone: new products USA: (OXECTA), (ROXYCODONE)
- Oxycodone + Ibuprofen (COMBUNOX): available in USA. (5 / 400 mg)
- Oxymorphone (OPANA, OPANA ER): available in USA; IM, rectal, & recently oral; 3x more potent than oral morphine; avoid alcohol as ↑↑↑ peak concentrations. (IR tabs: 5,10mg; e.g 5mg q4-6h prn. ER tabs: 5, 7.5, 10,15,20,30, 40mg; e.g. 10mg q12h).
  - Oxymorphone OPANA ER Abuse Thrombotic thrombocytopenic purpura (TTP) strongly associated with injection drug abuse of OPANA ER.
- See also RxFiles Substance Abuse Chart: http://www.rxfiles.ca/rxfiles/uploads/documents/CHT-Substance-Abuse.pdf (sections: 4- Addiction screening; 5-Universal Precautions in Pain Medicine; 6-Red Flags for Aberrant Rx Drug Use)
- Oral Morphine for Cancer Pain: Systematic Review (Cochrane): Somewhat effective in 9/10 patients; 6/10 patients, very satisfied; 1/20 stopped due to AEs, Common AE: constipation, N&V.

Fentanyl Patches: "Attempting to give 1/2 patch"

The rate of medication delivery from Duragesic® patches is in proportion to the surface area of drug reservoir in contact with the skin. Prior to the availability of the 12.5 mcg/hr strength, the following procedure was occasionally used to achieve this rate:

1. An occlusive dressing like Opsite was put on the skin.
2. A 25 mcg/hr patch was then applied on top with half on the skin and half on the dressing.

This approach lacks documentation and can not be routinely recommended.

Fentanyl / Opioid Patch Exchange Tool: http://www.rxfiles.ca/rxfiles/uploads/documents/Opioid-Patch-Exchange-Disposal-Tool.pdf

Opioid Intolerance:

- **Pseudoallergy**
  - **COMMON**! May use non-opioid, lower opioid dose, alternate opioid even from same class; add H1 $_{\text{diphenhydramine}}$ +/- H2 $_{\text{ranitiidine}}$ blocker, moisturizers, cold compresses
    - Flushing, itching, hives, sweating, and/or mild hypotension
    - Itching, flushing or hives at injection site only

These symptoms **may** be due to a *pseudoallergy*. It's a result of histamine release, a pharmacologic side effect of some opioids. Options for this patient include:

1. A nonopioid analgesic (e.g., acetaminophen, an NSAID)
2. Avoidance of codeine, morphine, and meperidine, the opioids most commonly associated with pseudoallergy
3. Use of a more potent opioid less likely to release histamine. Potency, from lower to higher:
   meperidine<codeine<morphine<hydrocodone<oxycodone<hydromorphone<levorphanol<fentanyl
4. If needed, concurrent administration of an antihistamine…an H1 (e.g., diphenhydramine) and perhaps an H2 blocker (e.g., cimetidine)
5. Dose reduction, if tolerated

- **Potential true opioid allergy**
  - **RARE**! - would require change to non-opioid or opioid from different chemical class – see below
    - Severe hypotension
    - Skin reaction other than (Flushing, itching, hives)
    - Breathing, speaking, swallowing difficulties
    - Swelling of the face, lips, mouth, tongue, pharynx or larynx

Opioid Reversal Agent for Overdose: Naloxone (IV, IM, SC; sometimes intranasal off-label). Dose, initial 0.4-2mg IV for adults, may repeat q2-3 minutes up to total maximum of 10mg. Will precipitate withdrawal.
- Used to treat life threatening respiratory depression, and sometimes, since short acting, just to temporarily bring patient to consciousness to gather information, then allow back into unconsciousness while drug is eliminated from system.

Opioid Chemical Class

1. **Phenylpiperidines**: meperidine, fentanyl, sufentanil, remifentanil
2. **Diphenylheptanes**: methadone, propoxyphene
3. **Morphine group**: morphine, codeine, hydromorphone, oxycodone, oxymorphone, nalbuphine, butorphanol, levorphanol, pentazocine

New Drugs {Not yet in Canada)

- **Oral Oxymorphone**
  i. (Opana, Opana ER): **Potency** is about 10x more potent than morphine! Caution!. [Immediate release: 5, 10mg tabs; Extended release; 5, 10, 20, 40 mg tabs]

Amato L, Minozzi S, Davoli M, Vecchi S, Ferri MM, Mayet S. Psychosocial and pharmacological treatments versus pharmacological treatments for opioid detoxification. Cochrane Database Syst Rev. 2008 Oct 8;(4):CD005031. Psychosocial treatments offered in addition to pharmacological detoxification treatments are effective in terms of completion of treatment, use of opiate, results at follow-up and compliance. Although a treatment, like detoxification, that exclusively attenuates the severity of opiate withdrawal symptoms can be at best partially effective for a chronic relapsing disorder like opiate dependence, this type of treatment is an essential step prior to longer-term drug-free treatment and it is desirable to develop adjunct psychosocial approaches that might make detoxification more effective.

Amato L, Minozzi S, Davoli M, et al. Psychosocial and pharmacological treatments versus pharmacological treatments for opioid detoxification. Cochrane Database Syst Rev. 2011 Sep 7;9:CD005031. Psychosocial treatments offered in addition to pharmacological detoxification treatments are effective in terms of completion of treatment, use of opiate, participants abstinent at follow-up and clinical attendance.

Australian Prescriber: Caution with Codeine: http://www.australianprescriber.com/magazine/34/5/133/5. { Codeine is a weak opioid analgesic. It has to be converted to morphine, but there is significant inter-individual variation in its pharmacokinetics which results in variable effectiveness. Codeine's efficacy in clinical trials is generally modest and while its adverse events are usually mild, serious adverse events, including death, have occurred. Tolerance and drug dependence can occur. There is a risk of toxicity especially if combination products containing codeine and other drugs are misused. Treatment with simple analgesics, or other opioids if required, provides a more predictable response.}

CDC June/10 About one fifth of US high school students reported ever having used prescription drugs not prescribed to them, such as OxyContin, Percocet, Vicodin, Adderall, Ritalin, and Xanax. The CDC reports the first assessment of such use within the National Youth Risk Behavior Survey. In addition, prescription drug abuse was more common among white than Hispanic or black students. The agency highlighted these findings from the 2009 survey in the context of an ongoing national trend toward higher rates of nonsuicide-related overdoses and deaths associated with prescription drug abuse. 2009 National Youth Risk Behavior Survey (Free PDF)CDC news release (Free) 2007 *MMWR* article on unintentional poisoning deaths (Free)
CDC: Centers for Disease Control and Prevention (CDC). Emergency department visits involving nonmedical use of selected prescription drugs - United States, 2004-2008. MMWR Morb Mortal Wkly Rep. 2010 Jun 18;59(23):705-9. This report describes the results of that review, which showed that the estimated number of ED visits for nonmedical use of opioid analgesics increased 111% during 2004-2008 (from 144,600 to 305,900 visits) and increased 29% during 2007-2008. The highest numbers of ED visits were recorded for oxycodone, hydrocodone, and methadone, all of which showed statistically significant increases during the 5-year period. The estimated number of ED visits involving nonmedical use of benzodiazepines increased 89% during 2004-2008 (from 143,500 to 271,700 visits) and 24% during 2007-2008.

Eisenberg E, McNicol ED, Carr DB. Efficacy and safety of opioid agonists in the treatment of neuropathic pain of nonmalignant origin: systematic review and meta-analysis of randomized controlled trials. JAMA. 2005 Jun 22;293(24):3043-52. CONCLUSIONS: Short-term studies provide only equivocal evidence regarding the efficacy of opioids in reducing the intensity of neuropathic pain. Intermediate-term studies demonstrate significant efficacy of opioids over placebo for neuropathic pain, which is likely to be clinically important. Reported adverse events of opioids are common but not life-threatening. Further RCTs are needed to establish their long-term efficacy, safety (including addiction potential), and effects on quality of life.

Ekström MP, Bornefalk-Hermansson A, et al. Safety of benzodiazepines and opioids in very severe respiratory disease: national prospective study. BMJ. 2014 Jan 30;348.

FDA July/09 notified healthcare professionals that it is taking several actions to reduce the risk of overdose in patients using pain medications that contain propoxyphene because of data linking propoxyphene and fatal overdoses. The agency will require manufacturers of propoxyphene-containing products to strengthen the label, including the boxed warning, emphasizing the potential for overdose when using these products and to provide a medication guide to patients stressing the importance of using the drugs as directed.

FDA Nov/10 is requesting that manufacturers of the painkiller propoxyphene pull the drug from the market because of concerns over cardiotoxicity. (Propoxyphene is marketed alone as Darvon and combined with acetaminophen as Darvocet.) The agency's request is based on data showing that, even when taken at therapeutic doses, the drug can lead to potentially dangerous changes in the heart's electrical activity, including prolonged PR and QT intervals and widened QRS complex. The FDA advises clinicians to stop prescribing propoxyphene and to ask current users to discontinue the drug. FDA's MedWatch alert (Free)

FDA: July/12 Clinicians who prescribe extended-release and long-acting opioids may receive training as part of an FDA effort to curb misuse. With the risk evaluation and mitigation strategy, pharmaceutical companies must develop programs to train clinicians on how to choose patients for opioid therapy appropriately, how to weigh the risks and benefits for a given patient, how to counsel patients against misuse, and how to spot signs of opioid misuse and addiction. The first training programs are expected to be available by March 2013. Currently, this training is optional, but the Obama administration has endorsed a mandatory training plan.

FDA Aug/12 is reviewing reports of children who developed serious adverse effects or died after taking codeine for pain relief after tonsillectomy and/or adenoidectomy for obstructive sleep apnea syndrome. Recently, three pediatric deaths and one non-fatal but life-threatening case of respiratory depression were documented in the medical literature.

FDA Sep/13 Extended-release and long-acting (ER/LA) opioid pain relievers are no longer indicated for merely moderate pain, the US Food and Drug Administration (FDA) announced today as part of a sweeping move to stem the deadly misuse and abuse of the drugs. Previously, the labels for ER/LA opioid analgesics stated that they were indicated for "moderate to severe pain in patients requiring continuous, around-the-clock opioid treatment for an extended period of time." The labels now will state that the drugs are indicated "for the management of pain severe enough to require daily, around-the-clock opioid treatment and for which alternative treatments are inadequate."

Gowing L, et al. Opioid antagonists under heavy sedation or anaesthesia for opioid withdrawal. Cochrane Database Syst Rev. 2006 Apr 19;(2):CD002022. Heavy sedation compared to light sedation does not confer additional benefits in terms of less severe withdrawal or increased rates of commencement on naltrexone maintenance treatment. Given that the adverse events are potentially life-threatening, the value of antagonist-induced withdrawal under heavy sedation or anaesthesia is not supported. The high cost of anaesthesia-based approaches, both in monetary terms and use of scarce intensive care resources, suggest that this form of treatment should not be pursued.
Gowing L, Farrell M, Ali R, et al. Alpha(2)-adrenergic agonists for the management of opioid withdrawal. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD002024. Clonidine and lofexidine are more effective than placebo for the management of withdrawal from heroin or methadone. No significant difference in efficacy was detected for treatment regimes based on clonidine or lofexidine, and those based on reducing doses of methadone over a period of around 10 days but methadone is associated with fewer adverse effects than clonidine, and lofexidine has a better safety profile than clonidine.

Hadley G, Derry S, Moore RA, et al. Transdermal fentanyl for cancer pain. Cochrane Database Syst Rev. 2013 Oct 5;10:CD010270. The randomised trial literature for effectiveness of transdermal fentanyl is limited, but it is an important medicine. Most studies recruited fewer than 100 participants and did not provide data appropriate for meta-analysis. Only a few reported how many patients had good pain relief but, where data were reported, a majority had no worse than mild pain within a reasonably short time period. The evidence pointed to a useful and significant reduction in complaints about constipation for transdermal fentanyl compared with oral morphine.

Buprenorphine is an effective intervention for use in the maintenance treatment of heroin dependence, but it is less effective than methadone delivered at adequate dosages.

McNicol ED, Midbari A, Eisenberg E. Opioids for neuropathic pain. Cochrane Database Syst Rev. 2013 Aug 29;8:CD006146. doi: 10.1002/14651858.CD006146.pub2. Since the last version of this review, new studies were found providing additional information. Data were reanalyzed but the results did not alter any of our previously published conclusions. Short-term studies provide only equivocal evidence regarding the efficacy of opioids in reducing the intensity of neuropathic pain. Intermediate-term studies demonstrated significant efficacy of opioids over placebo, but these results are likely to be subject to significant bias because of small size, short duration, and potentially inadequate handling of dropouts. Analgesic efficacy of opioids in chronic neuropathic pain is subject to considerable uncertainty.

Opioid Treatment Agreements

- Useful for:
  - Identifying drug abuse
  - Reducing doctor shopping
  - Outlining how "requests" will be handled
    - E.g. early refills? Running out due to "borrowing from tomorrow"
  - Educating patients on:
    - What to expect?
    - What not too expect?
      - realistic expectations for 30-50% reduction in pain
    - Importance of non-drug interventions
    - Role or lack thereof for "prns" in therapeutic plan
  - Outline responsibilities and expectations
    - monitoring plans, especially functional goals
    - how opioids will be obtained and taken
    - use of concomitant drugs
    - storage and security requirements
    - consequences for non-adherence or aberrant behaviour
  - option of including informed consent components
  - proactive managing of highly functioning, charming and convincing individuals with borderline personality traits – to pre-empt typical conflict that can arise
- The more routine the clinicians use of an agreement, the easier it is!
  - Removes stigma of "suspicion" and any issues of trust
  - Offers best practice protection to all

[6] Bell KJ, Hayen A, Macaskill P, et al. Value of routine monitoring of **bone mineral density** after starting bisphosphonate treatment: secondary analysis of trial data. BMJ. 2009 Jun 23;338:b2266. doi: 10.1136/bmj.b2266. Monitoring bone mineral density in postmenopausal women in the first three years after starting treatment with a potent bisphosphonate is unnecessary and may be misleading. Routine monitoring should be avoided in this early period after bisphosphonate treatment is commenced.

Gillespie LD, Robertson MC, Gillespie WJ, et al. Interventions for preventing falls in older people living in the community. Cochrane Database of Systematic Reviews 2012, Issue 9. Group and home-based exercise programmes, and home safety interventions reduce rate of falls and risk of falling. Multifactorial assessment and intervention programmes reduce rate of falls but not risk of falling; Tai Chi reduces risk of falling. Overall, vitamin D supplementation does not appear to reduce falls but may be effective in people who have lower vitamin D levels before treatment.

Cameron ID, Gillespie LD, Robertson MC, Murray GR, Hill KD, Cumming RG, Kerse N. Interventions for **preventing falls** in older people in care facilities and hospitals. Cochrane Database of Systematic Reviews 2012, Issue 12. Art. No.: CD005465. DOI:10.1002/14651858.CD005465.pub3. In care facilities, vitamin D supplementation is effective in reducing the rate of falls. Exercise in subacute hospital settings appears effective but its effectiveness in care facilities remains uncertain due to conflicting results, possibly associated with differences in interventions and levels of dependency. There is evidence that multifactorial interventions reduce falls in hospitals but the evidence for risk of falling was inconclusive. Evidence for multifactorial interventions in care facilities suggests possible benefits, but this was inconclusive.

Santesso N, Carrasco-Labra A, Brignardello-Petersen R. Hip protectors for preventing hip fractures in older people. Cochrane Database Syst Rev. 2014 Mar 31;3:CD001255. doi: 10.1002/14651858.CD001255.pub5. Hip protectors probably reduce the risk of hip fractures if made available to older people in nursing care or residential care settings, without increasing the frequency of falls. However, hip protectors may slightly increase the small risk of pelvic fractures. Poor acceptance and adherence by older people offered hip protectors is a barrier to their use. Better understanding is needed of the personal and design factors that may influence acceptance and adherence.

Green J, Czanner G, Reeves G, Watson J, Wise L, Beral V. Oral bisphosphonates and risk of cancer of oesophagus, stomach, and colorectum: case-control analysis within a UK primary care cohort. BMJ. 2010 Sep 1;341:c4444. doi:10.1136/bmj.c4444. The risk of oesophageal cancer increased with 10 or more prescriptions for oral bisphosphonates and with prescriptions over about a five year period. In Europe and North America, the incidence of oesophageal cancer at age 60-79 is **typically 1 per 1000** population **over five years, and this is estimated to increase to about 2 per 1000 with five years' use** of oral bisphosphonates.
FDA July/11 notified healthcare professionals and patients about its ongoing review of data from published studies to evaluate whether use of oral bisphosphonate drugs is associated with an increased risk of cancer of the esophagus. FDA has not concluded that taking an oral bisphosphonate drug increases the risk of esophageal cancer. There are

insufficient data to recommend endoscopic screening of asymptomatic patients.

Avenell A, Mak JC, O`Connell D. Vitamin D and vitamin D analogues for preventing fractures in post-menopausal women and older men. Cochrane Database Syst Rev. 2014 Apr 14;4:CD000227. Vitamin D alone is unlikely to prevent fractures in the doses and formulations tested so far in older people. Supplements of vitamin D and calcium may prevent hip or any type of fracture. There was a small but significant increase in gastrointestinal symptoms and renal disease associated with vitamin D and calcium. This review found that there was no increased risk of death from taking calcium and vitamin D.

Conwell LS, Chang AB. **Bisphosphonates** for osteoporosis in people with **cystic fibrosis**. Cochrane Database Syst Rev. 2012 Apr 18;4:CD002010. Oral and intravenous bisphosphonates increase bone mineral density in people with cystic fibrosis. Severe bone pain and flu-like symptoms may occur with intravenous agents. Additional trials are needed to determine if bone pain is more common or severe (or both) with the more potent zoledronate and if corticosteroids ameliorate or prevent these adverse events. Additional trials are also required to further assess gastrointestinal adverse effects associated with oral bisphosphonates. Trials in larger populations are needed to determine effects on fracture rate and survival.

DIPART (**Vitamin D** Individual Patient Analysis of Randomized Trials) Group.Patient level pooled analysis of 68 500 patients from seven major vitamin D fracture trials in US and Europe. BMJ. 2010 Jan 12;340:b5463. doi:10.1136/bmj.b5463. This individual patient data analysis indicates that vitamin D given alone in doses of 10-20 microg is not effective in preventing fractures. By contrast, calcium and vitamin D given together reduce hip fractures and total fractures, and probably vertebral fractures, irrespective of age, sex, or previous fractures.

FDA Oct/10 **Atypical subtrochanteric femur fractures** are fractures in the bone just below the hip joint. Diaphyseal femur fractures occur in the long part of the thigh bone. These fractures are very uncommon and appear to account for less than 1% of all hip and femur fractures overall. Although it is not clear if bisphosphonates are the cause, these unusual femur fractures have been predominantly reported in patients taking bisphosphonates.

FDA Nov/10 has approved **denosumab** (marketed as **Xgeva**) for the prevention of fracture and bone pain in patients with cancer that has metastasized to the bone. FDA news release (Free) Xgeva prescribing information (Free PDF)

FDA July/11 notified healthcare professionals and patients about its ongoing review of data from published studies to evaluate whether use of **oral bisphosphonate** drugs is associated with an **increased risk of cancer of the esophagus**. FDA has not concluded that taking an oral bisphosphonate drug increases the risk of esophageal cancer. There are insufficient data to recommend endoscopic screening of asymptomatic patients.

FDA Sep/11 notified healthcare professionals and patients of an update to the drug label for **Reclast (zoledronic acid)** regarding the risk of kidney failure. Cases of acute renal failure requiring dialysis or having a fatal outcome following Reclast use have been reported to FDA. The revised label states that Reclast is contraindicated in patients with creatinine clearance less than 35 mL/min or in patients with evidence of acute renal impairment.

Am J Prev Med. 2009 Apr;36(4):366-75. All adult patients aged >or=50 years should be evaluated for risk factors for osteoporosis. Screening with BMD testing for osteoporosis is recommended in women aged >or=65 years and in men aged >or=70 years. Younger postmenopausal women and men aged 50-69 years should undergo screening if they have at least one major or two minor risk factors for osteoporosis. It is also recommended that clinicians consider using an osteoporosis risk-assessment tool to evaluate absolute fracture risk to determine appropriate osteoporosis therapies.

Mhaskar R, Redzepovic J, Wheatley K, Clark OAC, Miladinovic B, Glasmacher A, Kumar A, Djulbegovic B. **Bisphosphonates** in **multiple myeloma**: a network meta-analysis. Cochrane Database of Systematic Reviews 2012, Issue 5. Art. No.: CD003188. DOI: 10.1002/14651858.CD003188.pub3. Use of bisphosphonates in patients with MM reduces pathological vertebral fractures, SREs and pain. Assuming a baseline risk of 20% to 50% for vertebral fracture without treatment, between 8 and 20 MM patients should be treated to prevent vertebral fracture(s) in one patient. Assuming a baseline risk of 31% to 76% for pain amelioration without treatment, between 5 and 13 MM patients should be treated to reduce pain in one patient. With a baseline risk of 35% to 86% for SREs without treatment, between 6 and 15 MM patients should be treated to prevent SRE(s) in one patient. Overall, there were no significant adverse effects associated with the administration of bisphosphonates identified in the included RCTs. We found no evidence of superiority of any specific aminobisphosphonate (zoledronate, pamidronate or ibandronate) or nonaminobisphosphonate (etidronate or clodronate) for any outcome. However, zoledronate appears to be superior to placebo and

etidronate in improving overall survival.
MHRA Aug/12 There is an increased risk of **cancer associated with the long-term use of calcitonin**. Because of this risk, calcitonin-containing medicines should no longer be used in the treatment of osteoporosis. All intra-nasal calcitonin sprays, which are the only formulation of calcitonin licensed for osteoporosis, will be withdrawn from the European market.

Screen all women aged 65 and older; screen women younger than 65 if their 10-year fracture risk is similar to or greater than that of a 65-year-old white woman without additional risk factors — roughly 9%. (The article recommends using the WHO's FRAX tool to estimate fracture risk.) The USPSTF expanded its review to include men, and concludes that there is not enough evidence to determine whether screening is beneficial or harmful

Watts NB, Diab DL. **Long-term use** of bisphosphosphonates in osteoporosis. J Clin Endocrinol Metab 2010 February 19 (Epub ahead of print).
Bisphosphonates have demonstrated antifracture efficacy in randomized, placebo-controlled trials of 3 and 4 yr duration and have been widely used since the initial release of alendronate in 1995. For zoledronic acid and risedronate, an early effect (fractures reduced within 6-12 months of starting therapy) has been shown. A sustained effect for risedronate has been shown through 5 yr and suggested through 7 yr. Ten-year data with alendronate and 8 yr data with risedronate indicated good tolerability and safety; it is unlikely that longer-term studies will be done.

Extras, Links & References:

- **AMETOP**: **tetracaine** (amethocaine) **4% Gel** : Adults (including geriatrics) & children over 1 month of age: **Apply** contents of the tube to the skin starting from the centre of the area to be anesthetized & cover with an occlusive dressing. The contents expellable from 1 tube (approximately 1 g) will cover & anesthetize an area of up to 30cm^2 (6×5 cm {~ 3/4 area of a credit card}). Smaller areas of anesthetized skin may be adequate in infants & small children. Adequate anesthesia can usually be achieved for venepuncture following a 30-minute application time, & for venous cannulation following a 45-minute application time; after which the gel should be removed with a gauze swab & the site prepared with an antiseptic wipe in the normal manner. It is not necessary to apply tetracaine gel for longer than the above times & anesthesia is maintained for 4 to 6 hrs in most patients after a single application. [Clinical Trial in progress: Ametop vs Maxilene: http://www.druglib.com/trial/02/NCT00353002.html]

- **EMLA (lidocaine and prilocaine)** - for intact skin, requires occlusion, needs to be applied for at least one hour Dose — To attain adequate anesthesia, 1 to 2 g of EMLA cream should be applied per 10 sq cm (approximate size of a Canadian "toonie") of skin and covered with an occlusive dressing for 45 to 60 minutes. The maximum application areas recommended for children are Less than 10 kg —100 sq cm {~ 2.5x area of a credit card};10 to 20 kg — 600 sq cm; Greater than 20 kg — 2000 sq cm ; causes vasoconstriction.

See www.usask.ca/pediatrics/services/pain for information for parents on children's pain

- **acetaminophen use with vaccination:** may ↓ immunogenicity ∴ avoid if possible.
- **Benzocaine** –in NG tube placement controversial[10] Causes methemoglobinemia!!! AVOID!
- **Lidocaine iontophoresis** {Numby Stuff}: mild electric current penetrates skin more quickly; effective in 10-20min.[43] EMLA similar or slightly better.[44,45] (Tingle may be bothersome.)
- **TAC** tetracaine 0.5% / epinephrine 0.05% / cocaine ≤ 11.8%; AE: seizures, arrhythmias, fatal; requires narcotic storage (LET preferred)
- **Cancer Pain:** Reference [46]

[19] Lakeside clinic medical staff: {Quote: "I usually tell them I'm going to have to pinch them for a second (again no need to know the pinch is a needle) and that I'm going to put some magic potion on the cut so it doesn't hurt anymore. Parents can read to them from a BIG picture book if the wound is below their eyes, which also blocks their view of what I'm doing. Also, when inserting a needle, the tissue edge of the wound has no pain receptors, so entering the tissue from the wound edge, rather than going through skin is helpful. They still feel the burn of the local, but not the sharpness of the needle. Local kept in a warming cupboard or neutralized with bicarb is less painful too. Kids LOVE to talk about themselves--so asking lots of questions about who they play with, what their favorite things are, etc is a big distraction." }

Pain Intensity Scoring:

- Chose a scale that is age appropriate to patient & become familiar with using!
- Interpret in light of any other pain related physical factors (e.g. heart rate)
- Also interpret according to trends for improvement or worsening of pain control
- Sherbrooke algorithm for acute pain in children (post-op): gave regular analgesic according to pain scale: {0-3: acetaminophen; 3-6: naproxen + acetaminophen; 6-9: morphine + naproxen + acetaminophen; 9-10: notify MD. Overall ↓ in pain scores & a ↓ in opioid requirement.}
- Other links: **Visual Analogue Scale**: suitable for age 7+ {McGrath PA, Seifert CE, Speechley KN, et al. A new analogue scale for assessing children's pain: an initial validation study. Pain. 1996 Mar;64(3):435-43.} **Oucher Scale**: age 3-12: http://www.oucher.org/history.html
BMJ Clinical Review: Pain Management and Sedation for Children in the Emergency Setting: http://www.bmj.com/cgi/content/full/339/oct30_1/b4234

FLACC SCALE – for assessing pain in very young children non-verbal; suitable for cognitively impaired

Face	No particular expression or smile	Occasional grimace or frown, withdrawn, disinterested	Frequent to constant quivering chin, clenched jaw
Legs	Normal position or relaxed	Uneasy, restless, tense	Kicking, or legs drawn up
Activity	Lying quietly, normal position, moves easily	Squirming, shifting back and forth, tense	Arched, rigid or jerking
Cry	No cry (awake or asleep)	Moans or whimpers; occasional complaint	Crying steadily, screams or sobs, frequent complaints
Consolability	Content, relaxed	Reassured by occasional touching, hugging or being talked to, distractible	Difficult to console or comfort

- Each of the five categories (F) Face; (L) Legs; (A) Activity; (C) Cry; (C) Consolability is scored from 0-2, which results in a total score between zero and ten.
- From ***The FLACC****: A behavioral scale for scoring postoperative pain in young children*, by S Merkel and others, 1997, Pediatr Nurse 23(3), p. 293-297. Copyright 1997 by Jannetti Co. University of Michigan Medical Center.

Faces Pain Scale – Revised (FPS-R) – age 4+

This is a thumbnail image. The full-size FPS-R with instructions is available on page 3 at http://www.iasp-pain.org/FPSR Numbers are not shown to children.

Our study demonstrated that "facilitated tucking by parents" is not just equal, but preferable to other pain management methods when both efficacy and safety are considered.

Babl FE, Goldfinch C, et al. Does nebulized lidocaine reduce the pain and distress of nasogastric tube insertion in young children? A randomized, double-blind, placebo-controlled trial. Pediatrics. 2009 Jun;123(6):1548-55. Nasogastric tube insertion results in very high FLACC scores irrespective of lidocaine use. Nebulized lidocaine cannot be recommended as pain relief for nasogastric tube insertion in children. The delay and distress of nebulization likely outweigh a possible benefit in the postinsertion period.

Drendel AL, Lyon R, Bergholte J, et al. Outpatient pediatric pain management practices for fractures. Pediatr Emerg Care. 2006 Feb;22(2):94-9. Most children with fractures have the "worst" pain in the first 48 hours after injury and used analgesia for 3 days after injury. There are noteworthy functional limitations for both children and their caregivers. Ibuprofen and acetaminophen with codeine are the analgesics most commonly used, with no clear superiority.

Eidelman A, Weiss JM, Baldwin CL, et al. Topical anaesthetics for repair of dermal laceration. Cochrane Database of Systematic Reviews 2011, Issue 6. Art. No.: CD005364. DOI: 10.1002/14651858.CD005364.pub2. Based on mostly descriptive analysis, topical anaesthetics are possibly an efficacious, non-invasive means of providing analgesia prior to suturing of dermal lacerations.

Falagas ME, Vouloumanou EK, Plessa E, et al. Inaccuracies in dosing drugs with teaspoons and tablespoons. Int J Clin Pract. 2010 Aug;64(9):1185-9.

FDA Jan/09 An public health advisory reminds patients and physicians of potentially serious side effects from the improper use of topical anesthetics, including lidocaine, tetracaine, benzocaine, and prilocaine. The latest advisory was prompted by a small study that tested whether lidocaine reduced discomfort during breast mammography. No serious adverse events were noted. However, the FDA remains concerned about the potential for seizures, irregular heartbeat, and breathing problems when topical anesthetics are applied over a large area or are covered by plastic wrap or a heating pad. Two deaths were previously reported in women using the anesthetics before laser hair removal.

FDA Aug/12 is reviewing reports of children who developed serious adverse effects or died after taking codeine for pain relief after tonsillectomy and/or adenoidectomy for obstructive sleep apnea syndrome. Recently, three pediatric deaths and one non-fatal but life-threatening case of respiratory depression were documented in the medical literature.

Health Technol Assess. 2009 May;13(27):iii-iv, ix-x, 1-163. Young children who are unwell with fever should be treated with ibuprofen first, but the relative risks (inadvertently exceeding the maximum recommended dose) and benefits (extra 2.5 hours without fever) of using paracetamol plus ibuprofen over 24 hours should be considered.

Health Canada Apr/12 is informing Canadians that it has requested companies to add new risk statements to the packaging and labelling of licensed benzocaine products. In April 2011, Health Canada reminded Canadians of certain health risks associated with benzocaine products, including a very rare but serious blood condition known as methemoglobinemia that can affect sensitive individuals.

Wong T, Stang AS, Ganshorn H, et al. Combined and alternating paracetamol and ibuprofen therapy for febrile children. Cochrane Database of Systematic Reviews 2013, Issue 10. Art. No.: CD009572. DOI: 10.1002/14651858.CD009572.pub2. There is some evidence that both alternating and combined antipyretic therapy may be more effective at reducing temperatures than monotherapy alone.However, the evidence for improvements inmeasures of child discomfort remains inconclusive.

Zempsky WT, et al. Needle-free powder lidocaine delivery system provides rapid effective analgesia for venipuncture or cannulation pain in children: randomized, double-blind Comparison of Venipuncture and Venous Cannulation Pain After Fast-Onset Needle-Free Powder Lidocaine or Placebo Treatment trial. Pediatrics. 2008 May;121(5):979-87. The needle-free powder lidocaine delivery system was well tolerated and produced significant analgesia within 1 to 3 minutes.

RA - EXTRAS

Approach & Considerations for Drug Tx in RA

- Initial: DMARD + NSAID +/- Corticosteroid for symptoms. MTX often the DMARD of choice, however, HCQ is safer but suitable only for mild cases.
  -NSAIDs now used primarily for bridging and pain management.
  -Oral corticosteroids associated with complications, so use controversial. Short courses &/or low doses for ≤2yrs sometimes used (↓ joint pain & systemic symptoms). Intra-articular injections useful & few AEs.
  -Earlier combo DMARD or biologic tx warranted for those with high disease activity & poor prognostic factors.
  {Features of poor prognosis include: functional limitation, extraarticular disease rheumatoid nodules, RA vasculitis, Felty's syndrome, +'ve rheumatoid factor, anti-cyclic citrullinated peptide antibodies, bony erosions radiographic.}
- TNF inhibitors - 1st line biologics after an inadequate response to a DMARD. They are given +/- MTX (synergistic). Note, infliximab given with MTX (not recommended for monotherapy).
  - ◆Initial TNF inhibitor choice: varies with clinician (often etanercept rapid onset, short t ½ or infliximab)
  - ◆Relative to other agents, TNF-inhibitors may be more effective in relieving symptoms & limiting joint destruction. They often also act more rapidly.
  - ◆AEs: 1) Injection site reactions (back pain, fever, urticaria, dyspnea, ↓BP): common with etanercept, golimumab, certolizumab, & adalimumab.
    2) Cytopenia: uncommon, but can occur with any anti-TNF tx. Monitor CBC.
    3) The potential for Serious Infections: (eg. bacterial sepsis, TB reactivated & disseminated, fungal, viral & opportunistic unusual eg. *p. jiroveci*) are important; screen for active infection, latent TB, etc.
    4) Malignancies (esp. lymphomas): reported but causality not established. The condition of RA ↑ lymphoma risk on its own. Avoid anti-TNF tx in patients with recent ca.
    5) Other AEs: (rare) – CHF, reversible lupus-like syndrome, demyelinating conditions eg. M.S. (avoid if hx), hepatoxicity (caution with infliximab).
  - ◆If 1st TNF inhibitor is not effective, switching to a 2nd TNF inhibitor may be effective; however, many specialists will opt for a non-TNF biologic for a different mechanism of action.
- Non-TNF Biologics – include rituximab co-admin with a DMARD; pre-treat to prevent infusion reaction, abatacept +/- a DMARD, tocilizumab may work in ≥2wks, AEs (many; severe complications reported), anakinra less effective.
- Aggressive early therapy with MTX &/or a biologic ⇨ longer remissions, less joint destruction & improved quality of life.
- Combination Tx with 2-3 DMARDs (or a DMARD + biologic): often more effective than monotherapy without more toxicity.
  - ◆Triple DMARD Tx: MTX +SSZ + HCQ (+/- prednisone low-dose ≤7.5-10mg/day) effective. ◆MTX + Biologic more efficatious than either alone. ◆Combination of 2+ Biologics NOT recommended as ↑ toxicity!
- Comorbidity & biologics ACR RA 2012:
  - 1) Hepatitis
    a) Hep C ⇨ potentially recommend etanercept;
    b) Hep B: untreated chronic or treated chronic with Child-Pugh class B or higher: avoid any biologic!
  - 2) Malignancy
    a) treated solid malignancy >5yrs or non-melanoma skin ca >5ys ago – recommend any biologic;
    b) treated solid malignancy <5yr or treated non-melanoma skin ca within 5yr – recommend rituximab;
    c) treated skin melanoma, & treated lymphoproliferative malignancy – recommend rituximab;
  - 3) CHF
    a) NYHA class III-IV with ejection fraction ≤50%: avoid anti-TNF biologics!

Vaccinations: before DMARD or biologic, immunize for influenza, pneumococcal, hep-B & HZV. Live vaccines should not be given to patients on biologics (should be given ≥1 month prior to starting tx).

Pain Management in RA:

- Neuromodulators: Cochrane Review RCT, placebo controlled - few trials, all short term (~2-5 weeks) with high risk of bias (ie. Weak evidence)
  1) Nefopam (ACUPAN): not in Canada; 5HT, NE & DA receptor blocking; NNT=2 for pain relief, offset by significant SE's
  2) Topical capsaicin: reasonable add-onn option; NNT=2-3 for pain relief, offset by some burning at application site
  3) Oromucosal cannabis: small reduction in pain, highly offset by SE's leading to withdrawal (NNH=3) including dizziness 26%, dry mouth 13% & lightheadedness (10%)
  4) Lack of data for other agents included: anticonvulsants, ketamine, bupropion, methylphenidate

Bongartz T, et al. Anti-TNF antibody therapy in rheumatoid arthritis and the risk of **serious infections & malignancies**: systematic review & meta-analysis of rare harmful effects in randomized controlled trials. JAMA. 2006 May 17;295(19):2275-85. (see also Pharmacist's Letter July 2006) Malignancies were significantly more common in patients treated with higher doses compared with patients who received lower doses of anti-TNF antibodies. For patients treated with anti-TNF antibodies in the included trials, the number needed to harm was 154 (95% CI, 91-500) for 1 additional malignancy within a treatment period of 6 to 12 months. For serious infections, the number needed to harm was 59 (95% CI, 39-125) within a treatment period of 3 to 12 months. (Health Canada July/06 Possible Association of REMICADE® with hepatosplenic T-cell lymphoma in pediatric and young adult patients with Crohn's disease http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2006/remicade_3_hpc-cps_e.html) (Setoguchi S, et al. Tumor necrosis factor alpha antagonist use and cancer in patients with rheumatoid arthritis. Arthritis Rheum. 2006 Aug 31;54(9):2757-2764 [Epub ahead of print] Our results indicate that users of biologic agents are unlikely to have a substantial increase in the risk of hematologic malignancies and solid tumors as compared with MTX users. Despite the use of large combined data sets, studying the effect of an infrequent exposure (biologic DMARDs) on rare diseases (hematologic malignancies) remains a challenge.) (Wolfe F, Michaud K. The effect of methotrexate and anti-tumor necrosis factor therapy on the risk of lymphoma in rheumatoid arthritis in 19,562 patients during 89,710 person-years of observation. Arthritis Rheum. 2007 May;56(5):1433-9. In a study of lymphoma in 19,591 RA patients over 89,710 person-years of followup, which included exposure to anti-TNF therapy in 10,815 patients, we did not observe evidence for an increase in the incidence of lymphoma among patients who received anti-TNF therapy.)

FDA July/10 will require that the label for the rheumatoid arthritis drug **leflunomide (Arava)** carry an added warning for severe liver injury. The label already warns against the drug's use in pregnant women and those of childbearing potential. The new warning comes after the FDA received **49 reports of severe liver injury**, including 14 instances of fatal liver failure, from 2002 to 2009. Risk for liver injury was higher among patients using other drugs associated with liver injury and patients with liver disease. Clinicians should monitor liver enzymes at least monthly for 3 months after beginning the drug. After that, enzymes should be monitored every quarter. Treatment should be halted if liver enzymes rise to two times the upper limit of normal. http://www.fda.gov/Safety/MedWatch/SafetyInformation/SafetyAlertsforHumanMedicalProducts/ucm218912.htm
FDA Sep/11 notified healthcare professionals that the Boxed Warning for the entire class of **Tumor Necrosis Factor-alpha (TNFα) blockers** has been updated to include the risk of infection from two bacterial pathogens, **Legionella and Listeria**. In addition, the Boxed Warning and Warnings and Precautions sections of the labels for all of the TNFα blockers have been revised so that they contain consistent information about the risk for serious infections and the associated disease-causing pathogens.

Clinical and radiographic outcomes of **four different treatment strategies in patients with early rheumatoid arthritis (the BeSt study)**: A randomized, controlled trial. Arthritis Rheum. 2005 Nov;52(11):3381-90. CONCLUSION: In patients with early RA, initial combination therapy including either prednisone or infliximab resulted in earlier functional improvement and less radiographic damage after 1 year than did sequential monotherapy or step-up combination therapy. (Goekoop-Ruiterman YP, de Vries-Bouwstra JK, Allaart CF, et al. Comparison of treatment strategies in early rheumatoid arthritis: a randomized trial (BeSt). Ann Intern Med. 2007 Mar 20;146(6):406-15. Currently available antirheumatic drugs can be highly effective in patients with early rheumatoid arthritis in a setting of tight disease control. Initial combination therapies seem to provide earlier clinical improvement and less progression of joint damage, but all treatment strategies eventually showed at 2yrs similar clinical improvements. In addition, combination therapy can be withdrawn successfully and less treatment adjustments are needed than with initial monotherapies.)

Hjardem E, Ostergaard M, Podenphant J, et al.. Do rheumatoid arthritis patients in clinical practice benefit from **switching from infliximab to a second tumor necrosis factor** alpha inhibitor? Ann Rheum Dis. 2007 Sep;66(9):1184-9. Epub 2007 Mar 27. Lack of efficacy switchers had a better clinical response to the second treatment. Adverse effect switchers responded equally well to both treatments, with a low risk of discontinuing the second drug as a result of AE. Drug survival of the switchers' second biological therapy was higher than of the first, but lower than that of non-switchers. No difference between various sequences of drugs were found. Danish post-marketing data thus support that RA patients may benefit from switching biological therapy.

Setoguchi S, et al. **Tumor necrosis factor** alpha antagonist use and **cancer** in patients with rheumatoid arthritis. Arthritis Rheum. 2006 Sep;54(9):2757-64. Comparing biologic DMARD users with MTX users, the propensity score-adjusted pooled hazard ratio was 1.37 (95% confidence interval 0.71-2.65) for hematologic malignancies and 0.91 (95% confidence interval 0.65-1.26) for solid tumors. Our results indicate that users of biologic agents are unlikely to have a substantial increase in the risk of hematologic malignancies and solid tumors as compared with MTX users.

Singh JA, Noorbaloochi S, Singh G. **Golimumab** for rheumatoid arthritis. Cochrane Database Syst Rev. 2010 Jan 20;(1):CD008341.
Singh JA, Beg S, Lopez-Olivo MA. **Tocilizumab** for rheumatoid arthritis. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008331. Tocilizumab is beneficial in decreasing RA disease activity and improving function. Tocilizumab treatment was associated with significant increase in cholesterol levels and in total adverse events. Larger safety studies are needed to address these safety concerns.
Singh JA, Wells GA, Christensen R, et al. **Adverse effects of biologics**: a network meta-analysis and Cochrane overview. Cochrane Database of Systematic Reviews 2011, Issue 2. Art. No.: CD008794. DOI: 10.1002/14651858.CD008794.pub2. Overall, in the short term biologics were associated with significantly higher rates of total adverse events, withdrawals due to adverse events and TB reactivation. Some biologics had a statistically higher association with certain adverse outcomes compared to control, but there was no consistency across the outcomes so caution is needed in interpreting these results.

Solomon DH, Avorn J, Katz JN, et al. **Immunosuppressive medications** and hospitalization for **cardiovascular events** in patients with rheumatoid arthritis. Arthritis Rheum. 2006 Nov 29;54(12):3790-3798. Monotherapy with oral glucocorticoids was associated with an increased risk of cardiovascular events (OR 1.5, 95% CI 1.1 - 2.1), and a similar trend in the direction of risk was seen with glucocorticoid combination therapy (OR 1.3, 95% CI 0.8-2.0). Cytotoxic immunosuppressive agents other than MTX (azathioprine, cyclosporine, and leflunomide) were also associated with an increased risk of cardiovascular events (with both monotherapy and combination treatment, OR 1.8, 95% CI 1.1-3.0). When compared with RA patients receiving MTX monotherapy, those receiving biologic immunosuppressive agents had neither an increased nor decreased risk of experiencing a cardiovascular event, whereas use of oral glucocorticoids and cytotoxic immunosuppressive agents was associated with significant increases in the risk of cardiovascular events.

Weinblatt M, et al. Safety of the selective costimulation modulator **abatacept** in rheumatoid arthritis patients receiving background biologic and nonbiologic disease-modifying antirheumatic drugs: A one-year randomized, placebo-controlled study. Arthritis Rheum. 2006 Aug 31;54(9):2807-2816 [Epub ahead of print] Abatacept in combination with synthetic DMARDs was well tolerated and improved physical function and physician- and patient-reported disease outcomes. However, abatacept in combination with biologic background therapies was associated with an increase in the rate of serious adverse events. Therefore, abatacept is not recommended for use in combination with biologic therapy.

Westhovens R, et al. The safety of infliximab, combined with background treatments, among patients with rheumatoid arthritis and various comorbidities: A large, randomized,placebo-controlled trial. Arthritis Rheum. 2006 Mar 29;54(4):1075-1086 [Epub ahead of print] CONCLUSION: The risk of serious infections in patients receiving the approved infliximab dose of 3 mg/kg plus MTX was similar to that in patients receiving MTX alone. Patients receiving the unapproved induction regimen of 10 mg/kg infliximab plus MTX followed by a 10 mg/kg maintenance regimen had an increased risk of serious infections through week 22.

[38] Ronald C. Petersen, Ph.D., M.D., Ronald G. Thomas, Ph.D., Michael Grundman, M.D., M.P.H., et al., for the Alzheimer's Disease Cooperative Study Group Vitamin E & Donepezil for the Treatment of **Mild Cognitive Impairment.** N Engl J Med 2005
June 9;352:2379-88. (Conclusions: Vitamin E had no benefit in patients with mild cognitive impairment. Although donepezil therapy was associated with a lower rate of progression to Alzheimer's disease during the first 12 months of treatment, the rate of progression to Alzheimer's disease after three years was not lower among patients treated with donepezil than among those given placebo.) (InfoPOEMs: Vitamin E does not slow progression of mild cognitive impairment to full-fledged Alzheimer's disease. Donepezil provides an early benefit that is gone by 3yr. A secondary analysis found that donepezil appeared more beneficial for pts with the apolipoprotein E4 (APOE) gene. This finding requires prospective confirmation before we begin to test all pts with mild cognitive impairment for APOE & use it to guide therapy.(LOE = 1b)) Lu PH, Edland SD, Teng E, Tingus K, Petersen RC, Cummings JL; Alzheimer's Disease Cooperative Study Group. Donepezil treatment of patients with MCI: A 48-week randomized, placebo-controlled trial. Neurology 2009 May 5; 72:1555.

Russ TC, Morling JR. **Cholinesterase inhibitors for mild cognitive impairment**. Cochrane Database Syst Rev. 2012 Sep 12;9:CD009132. doi: 10.1002/14651858.CD009132.pub2. There is very little evidence that cholinesterase inhibitors affect progression to dementia or cognitive test scores in mild cognitive impairment. This weak evidence is overwhelmed by the increased risk of adverse events, particularly gastrointestinal. Cholinesterase inhibitors should not be recommended for mild cognitive impairment.

[74] Schneider LS, Tariot PN, Dagerman KS, et al. **CATIE-AD** Study Group. Effectiveness of atypical antipsychotic drugs in patients with Alzheimer's disease. N Engl J Med. 2006 Oct 12;355(15):1525-38. (n=421 36weeks risperidone 1mg/d, olanzapine 5.5mg/d, & quetiapine 56.5mg/d) Adverse effects offset advantages in the efficacy of atypical antipsychotic drugs for the treatment of psychosis, aggression, or agitation in patients with Alzheimer's disease. There were no significant differences among treatments with regard to the time to the discontinuation of treatment for any reason: olanzapine (median, 8.1 weeks), quetiapine (median, 5.3 weeks), risperidone (median, 7.4 weeks), and placebo (median, 8.0 weeks) (P=0.52). The median time to the discontinuation of treatment due to a lack of efficacy favored olanzapine (22.1 weeks) and risperidone (26.7 weeks) as compared with quetiapine (9.1 weeks) and placebo (9.0 weeks) (P=0.002). The time to the discontinuation of treatment due to adverse events or intolerability favored placebo. Overall, 24% of patients who received olanzapine, 16% of patients who received quetiapine, 18% of patients who received risperidone, & 5% of patients who received placebo discontinued their assigned treatment owing to intolerability (P=0.009). No significant differences were noted among the groups with regard to improvement on the CGIC scale. Improvement was observed in 32% of patients assigned to olanzapine, 26% of patients assigned to quetiapine, 29% of patients assigned to risperidone, and 21% of patients assigned to placebo (P=0.22). (InfoPOEMs: Atypical antipsychotics are minimally, if at all, effective for patients with Alzheimer's disease (AD), and they have significant adverse effects. They should not be routinely used for the treatment of psychosis, agitation, or aggression in these patients. (LOE = 1b))

[75] Hien le TT, Cumming RG, Cameron ID, et al. Atypical antipsychotic medications and **risk of falls** in residents of aged care facilities. J Am Geriatr Soc. 2005 Aug;53(8):1290-5. CONCLUSION: Despite fewer extrapyramidal side effects, atypical antipsychotic medications are not associated with fewer falls than the older, more-established antipsychotics.

Komossa K, Rummel-Kluge C, Schwarz S, et al. Risperidone versus other atypical antipsychotics for schizophrenia. Cochrane Database Syst Rev. 2011 Jan 19;1:CD006626. Risperidone seems to produce somewhat more extrapyramidal side effects and clearly more prolactin increase than most other SGAs. It may also differ from other compounds in efficacy and in the occurrence of other adverse effects such as weight gain, metabolic problems, cardiac effects, sedation and seizures. Nevertheless, the large proportion of participants leaving studies early and incomplete reporting of outcomes makes it difficult to draw firm conclusions.

Tabet N, Feldmand H. **Ibuprofen** for Alzheimer's disease. Cochrane Database Syst Rev. 2003;(2):CD004031. (Naproxen 220 mg BID and celecoxib 200 mg BID or placebo. do not prevent AD in early results from a randomized controlled trial. **ADAPT** Research Group Neurology. 2007 Apr 25; [Epub ahead of print] These results do not support the hypothesis that celecoxib or naproxen prevent Alzheimer dementia, at least within the early years after initiation of treatment. Masked long-term follow-up of these participants will be essential. Kang JH, Cook N, Manson J, Buring JE, Grodstein F. Low dose aspirin and cognitive function in the **Women's Health Study** cognitive cohort. BMJ. 2007 Apr 27; [Epub ahead of print] n=6377 mean 9.6yr. Long term use of low dose aspirin (100mg on alternate days) does not provide overall benefits for cognition among generally healthy women aged 65 or more.)
ADAPT Research Group. Cognitive Function Over Time in the Alzheimer's Disease Anti-inflammatory Prevention Trial (ADAPT): Results of a Randomized, Controlled Trial of Naproxen and Celecoxib. Arch Neurol. 2008 May 12. [Epub ahead of print] Use of naproxen or celecoxib did not improve cognitive function. There was weak evidence for a detrimental effect of naproxen.
Arvanitakis Z, Grodstein F, Bienias JL, Schneider JA, Wilson RS, Kelly JF, Evans DA, Bennett DA. Relation of NSAIDs to incident AD, change in cognitive function, and AD pathology. Neurology. 2008 Jun 3;70(23):2219-25. These data do not support a strong relation between nonsteroidal anti-inflammatory drugs and Alzheimer disease or cognition. Consistent findings across clinical and pathologic outcomes provide additional confidence in these results.
Price JF, Stewart MC, et al. AAA Trialists. Low dose aspirin and cognitive function in middle aged to elderly adults: randomised controlled trial. BMJ. 2008 Sep 1;337:a1198. doi: 10.1136/bmj.a1198. Low dose aspirin (100 mg daily) or placebo for five years. Low dose aspirin does not affect cognitive function in middle aged to elderly people at increased cardiovascular risk.
Jaturapatporn D, Isaac MG, McCleery J, et al. Aspirin, steroidal and non-steroidal anti-inflammatory drugs for the treatment of Alzheimer`s disease. Cochrane Database Syst Rev. 2012 Feb 15;2:CD006378. Based on the studies carried out so far, the efficacy of aspirin, steroid and NSAIDs (traditional NSAIDs and COX-2 inhibitors) is not proven. Therefore, these drugs cannot be recommended for the treatment of AD.
[132] Le Bars PL, Katz MM, Berman N, et al. A placebo-controlled, double-blind, randomized trial of an extract of **Ginkgo** biloba for dementia. North American EGb Study Group. JAMA. 1997 Oct 22-29;278(16):1327-32.

Declercq T, Petrovic M, Azermai M, Vander Stichele R, De Sutter AIM, van Driel ML, Christiaens T. **Withdrawal versus continuation of chronic antipsychotic drugs for behavioural and psychological symptoms in older people with dementia**. Cochrane Database of Systematic Reviews 2013, Issue 3. Art. No.: CD007726. DOI: 10.1002/14651858.CD007726.pub2. Our findings suggest that many older people with Alzheimer's dementia and NPS can be withdrawn from chronic antipsychotic medication without detrimental effects on their behaviour. It remains uncertain whether withdrawal is beneficial for cognition or psychomotor status, but the results of this review suggest that discontinuation programmes could be incorporated into routine practice. However, two studies of people whose agitation or psychosis had previously responded well to antipsychotic treatment found an increased risk of relapse or shorter time to relapse after discontinuation. Two other studies suggest that people with more severe NPS at baseline could benefit from continuing their antipsychotic medication. In these people, withdrawal might not be recommended.

Lonergan E, Luxenberg J, Areosa Sastre A, Wyller TB. **Benzodiazepines** for delirium. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD006379. No adequately controlled trials could be found to support the use of benzodiazepines in the treatment of non-alcohol withdrawal related delirium among hospitalised patients, and at this time benzodiazepines cannot be recommended for the control of this condition. Because of the scarcity of trials with randomization of patients, placebo control, and adequate concealment of allocation of subjects, it is clear that further research is required to determine the role of benzodiazepines in the treatment of non-alcohol withdrawal related delirium.

Oral administration of naftidrofuryl is well-tolerated by patients with dementia.The low-quality evidence shows that, by use of naftidrofuryl, people with dementia may benefit on performance, behaviour, cognition, and mood. However, the benefit on global impression is inconsistent and unconvincing.

Malouf R, Grimley Evans J. **Folic acid with or without vitamin B12** for the prevention & treatment of healthy elderly and demented people. Cochrane Database Syst Rev. 2008 Oct 8;(4):CD004514. The small number of studies which have been done provide no consistent evidence either way that folic acid, with or without vitamin B12, has a beneficial effect on cognitive function of unselected healthy or cognitively impaired older people. In a preliminary study, folic acid was associated with improvement in the response of people with Alzheimer`s disease to cholinesterase inhibitors. In another, long-term use appeared to improve the cognitive function of healthy older people with high homocysteine levels. More studies are needed on this important issue.

Cochrane Database of Systematic Reviews 2011, Issue 1. Art. No.: CD006220. DOI: 10.1002/14651858.CD006220.pub2. There is evidence that cognitive interventions do lead to performance gains but none of the effects observed could be attributable specifically to cognitive training, as the improvements observed did not exceed the improvement in active control conditions. This does not mean that longer, more intense or different interventions might not be effective, but that those which have been reported thus far have only limited effect. We therefore suggest more standardized study protocols in order to maximize comparability of studies and to maximize the possibility of data pooling - also in other cognitive domains than memory.

McGuinness B, Todd S, Passmore P, Bullock R. The effects of blood pressure lowering on development of cognitive impairment & dementia in patients without apparent prior cerebrovascular disease. Cochrane Database Syst Rev. 2006 Apr 19;(2):CD004034. There was no convincing evidence from the trials identified that blood pressure lowering prevents the development of dementia or cognitive impairment in hypertensive patients with no apparent prior cerebrovascular disease. There were significant problems identified with analysing the data, however, due to the number of patients lost to follow-up and the number of placebo patients given active treatment. This introduced bias. More robust results may be obtained by analysing one year data to reduce differential drop-out or by conducting a meta- analysis using individual patient data.

McGuinness B, O`Hare J, Craig D, et al. Statins for the treatment of dementia. Cochrane Database Syst Rev. 2010 Aug 4;8:CD007514. There is insufficient evidence to recommend statins for the treatment of dementia. Analysis from the studies available, including one large RCT, indicate statins have no benefit on the outcome measures ADAS-Cog or MMSE. We need to await full results from CLASP 2008 before we can be certain.

DOI:10.1002/14651858.CD006929.pub2. The delivery of FA has been incorporated within wide ranging multi-component programmes and study designs have varied according to setting - i.e. family care, care homes and hospital, with surprisingly few studies located in care homes. Our findings suggest potential beneficial effects of multi-component interventions, which utilise FA. Whilst functional analysis for challenging behaviour in dementia care shows promise, it is too early to draw conclusions about its efficacy.

Cochrane Database of Systematic Reviews 2010, Issue 12. Art. No.: CD006629. DOI: 10.1002/14651858.CD006629.pub2. Evidence from this review suggests that switching antipsychotic medication to one with lesser potential for causing weight gain or metabolic problems could be an effective way to manage these side effects, but the data were weak due to the limited number of trials in this area and small sample sizes. Poor reporting of data also hindered using some trials and outcomes. There was no difference in mental state, global state and other treatment related adverse events between switching to another medication and continuing on the previous one. When the three switching strategies were compared none of them had an advantage over the others in their effects on the primary outcomes considered in this review. Better designed trials with adequate power would provide more convincing evidence for using medication switching as an intervention strategy.

Orgeta V, Qazi A, Spector AE, et al. **Psychological treatments for depression and anxiety** in dementia and mild cognitive impairment. Cochrane Database Syst Rev. 2014 Jan 22;1:CD009125. We found evidence that psychological interventions added to usual care can reduce symptoms of depression and clinician-rated anxiety for people with dementia. We conclude that psychological interventions have the potential to improve patient well-being. Further high quality studies are needed to investigate which treatments are most effective and to evaluate the effect of psychological interventions in people with MCI.

Peters R, Beckett N, Forette F, et al. **HYVET** investigators. Incident dementia and blood pressure lowering in the Hypertension in the Very Elderly Trial cognitive function assessment (**HYVET-COG**): a double-blind, placebo controlled trial. Lancet Neurol. 2008 Aug;7(8):683-9. Epub 2008 Jul 7. Antihypertensive treatment in elderly patients does not statistically reduce incidence of dementia. This negative finding might have been due to the short follow-up, owing to the early termination of the trial, or the modest effect of treatment. Nevertheless, the HYVET findings, when included in a meta-analysis, might support antihypertensive treatment to reduce incident dementia.

Seitz DP, Adunuri N, Gill SS, et al. **Antidepressants for agitation and psychosis** in dementia. Cochrane Database Syst Rev. 2011 Feb 16;2:CD008191. Currently there are relatively few studies of antidepressants for the treatment of agitation and psychosis in dementia. The SSRIs sertraline and citalopram were associated with a reduction in symptoms of agitation when compared to placebo in two studies. Both SSRIs and trazodone appear to be tolerated reasonably well when compared to placebo, typical antipsychotics and atypical antipsychotics.

Declercq T, Petrovic M, Azermai M, Vander Stichele R, De Sutter AIM, van Driel ML, Christiaens T. Withdrawal versus continuation of chronic antipsychotic drugs for behavioural and psychological symptoms in older people with dementia. Cochrane Database of Systematic Reviews 2013, Issue 3. Art. No.: CD007726. DOI: 10.1002/14651858.CD007726.pub2. Our findings suggest that many older people with Alzheimer's dementia and NPS can be withdrawn from chronic antipsychotic medication without detrimental effects on their behaviour. It remains uncertain whether withdrawal is beneficial for cognition or psychomotor status, but the results of this review suggest that discontinuation programmes could be incorporated into routine practice. However, two studies of people whose agitation or psychosis had previously responded well to antipsychotic treatment found an increased risk of relapse or shorter time to relapse after discontinuation. Two other studies suggest that people with more severe NPS at baseline could benefit from continuing their antipsychotic medication. In these people, withdrawal might not be recommended.

Recommendations for determining the level of concern when considering treatment modification based on **relapse**:

Criteria	Level of Concern		
	Low	Medium	High
Rate	1 relapse in 2nd year of tx	1 relapse in 1st yr of tx	>1 relapse in the 1st yr of tx
Severity	**Mild**	**Moderate**	**Severe**
	-steroids not required	-steroids required	-steroids/ hospitalization required
	-minimal effect on ADL	-moderate effect on ADL	-severe effect on ADL
	-1 functional domain affected	->1 functional domain affected	->1 functional domain affected
	-no or mild motor/cerebellar involvement	-moderate motor/cerebellar involvement	-severe motor/cerebellar involvement
Recovery	-prompt recovery	-incomplete recovery at 3 months	-incomplete recovery at 6 months
	-no functional deficit	-some functional impairment	-functional impairment

Recommendations for determining the level of concern when considering treatment modification based **disability progression**:

Criteria	Level of Concern		
EDSS score:	Low	Medium	High
≤ 3.5	≤ 1 points	2 points at 6months	>2 points at 6months 2 points at 12months
4-5	<1 point	1 point at 6 months	>1 point at 6months 1 point at 12months
≥5.5		0.5 points at 6months	>0.5 points at 6 months
Clinically Documented Progression	No motor Minor sensory	Some motor, cerebellar or cognitive Multiple EDSS domains affected	Pronounced motor, cerebellar or cognitive Multiple EDSS domains affected
T25FW	≤ 20% confirmed at 6months	>20% and ,100% increase confirmed at 6months	≥ 100% increase confirmed at 6 months

Recommendations for determining the level of concern when considering treatment modification based on annual MRI findings:

Criteria	Level of Concern		
	Low	Medium	High
Activity on MRI:			
New Gd-enhancing Lesions OR accumulation Of new T2 lesions per year	1 lesion	2 lesion	≥3 lesions

Pucci E, Giuliani G, Solari A, Simi S, Minozzi S, Di Pietrantonj C, Galea I. **Natalizumab** for relapsing remitting multiple sclerosis. Cochrane Database of Systematic Reviews 2011, Issue 10. Art. No.: CD007621. DOI: 10.1002/14651858.CD007621.pub2. Although one trial did not contribute to efficacy results due to its duration, we found robust evidence in favour of a reduction in relapses and disability at 2 years in RRMS patients treated with NTZ. The drug was well tolerated. There are current significant safety concerns due to reporting of an increasing number of PML cases in patients treated with NTZ. This review was unable to provide an up-to-date systematic assessment of the risk due to the maximum 2 year-duration of the trials included. An independent systematic review of the safety profile of NTZ is warranted. NTZ should be used only by skilled neurologists in MS centres under surveillance programs.

(Yousry TA, Major EO, Ryschkewitsch C, et al. Evaluation of patients treated with natalizumab for progressive multifocal leukoencephalopathy. N Engl J Med. 2006 Mar 2;354(9):924-33.) (May 3, 2007 - Biogen Idec (NASDAQ: BIIB) and Elan Corporation, plc (NYSE: ELN) announced today that new data from the TOUCH Prescribing Programä and TYGRIS safety study confirm the safety profile from previous clinical studies of TYSABRI® (natalizumab). Also presented at the 59th annual meeting of the American Academy of Neurology in Boston, MA were extension study data that showed that TYSABRI has a sustained treatment effect on clinical relapses and the risk of disability progression in multiple sclerosis (MS) patients treated for up to three years. The companies recently reported that as of mid-April 2007 approximately 12,500 patients have been prescribed TYSABRI worldwide. The companies estimate that in both commercial use and clinical trials, there are currently over 10,000 patients on TYSABRI therapy worldwide. No New PML Cases 10 Months After Tysabri Allowed Back on Market. The drug is currently being used by more than 10,00 patients worldwide -- including roughly 6600 in the U.S. -- the manufacturer said.) July 31/08 Biogen, Elan Report Brain Infections in Patients Shares of Biogen Idec Inc. and Elan Corp. fell sharply in late trading Thursday, after the companies said their multiple sclerosis drug Tysabri has been linked to **two new cases** of a rare and often fatal brain inflammation.
Goodin DS, Cohen BA, O'Connor P, Kappos L, Stevens JC; Therapeutics and Technology Assessment Subcommittee of the **American Academy of Neurology**. Assessment: the use of natalizumab (Tysabri) for the treatment of multiple sclerosis (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 Sep 2;71(10):766-73. The **PML** risk in a pooled clinical trial cohort has been estimated to be 1 person for every 1,000 patients treated for an average of 17.9 months, although this figure could change in either direction with more experience with the drug.
December 17, 2008 — Biogen Idec and Élan reported to the United States Securities and Exchange Commission (SEC) that "relevant regulatory agencies" had been informed of another case of progressive multifocal leukoencephalopathy (PML) with natalizumab (Tysabri) monotherapy in a patient with multiple sclerosis (MS). The case was found through surveillance, the companies note, and the patient is stable. The male patient is from Germany and had been on natalizumab monotherapy for 26 months. He is reported to be stable and under the care of his physician. The companies released information on their December 11 Form 8-K report to the SEC December 15.

FDA Sep/09 documents 13 PML cases http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/ucm107198.htm
October 27, 2009 — The European Medicines Agency (EMEA) disclosed October 23 that it has begun a review of the risk–benefit balance for use of natalizumab (*Tysabri*, Biogen Idec/Elan) in relapsing-remitting multiple sclerosis in light of new cases of progressive multifocal leukoencephalopathy (PML) with treatment. The EMEA notes it started a review of the benefits and risks of natalizumab because reports of PML cases worldwide have climbed now to 23 since the drug was reinstated in the market in 2006. "This review is initiated to discuss any additional measures necessary to ensure the safe use of Tysabri and how to balance the risks to the patients against the benefits of the treatment," a press release from EMEA notes. The release was a round-up of EMEA activities as of October 2009. Natalizumab was taken off the market in February 2005 after the first 3 cases of PML were reported. On September 23, 2009, the US Food and Drug Administration (FDA) reported that the count for confirmed cases of PML worldwide in patients treated with natalizumab as monotherapy had reached 13. They have now confirmed the new total case count at 23.
Jan 21,2010 (Dow Jones)--As of Wednesday, there have been 31 cases of a rare brain infection in multiple sclerosis patients on Tysabri, sold by Biogen Idec Inc. (BIIB) and Elan Corp. (ELN), according to a review by a European regulatory panel. The European Medicines Agency's Committee for Medicinal Products for Human Use, known as CHMP, reported the cases of progressive multifocal leukoencephalopathy, or PML, in a review of the drug that concluded its rewards outweigh its risks and the drug should stay on the market. Of the **31 cases**, 23 of the patients were on the drug for more than two years, which puts the infection rate at about 1 in 1,000 patients for those exceeding that duration.
This assertion is the same held by the company and implied by the drug's label.
FDA Feb/10 notified healthcare professionals and patients that the risk of developing progressive multifocal leukoencephalopathy (PML) increases with the number of Tysabri infusions received. This new safety information, based on reports of 31 confirmed cases of PML received by the FDA as of January 21, 2010, will now be included in the Tysabri drug label and patient *Medication Guide*.
March 18, 2010 9:22 AM EDT Biogen Idec (Nasdaq: BIIB) disclosed that the number of PML cases involving those taking its Tysabri drug has increased to 42 patients with 9 who have died.
May/10 Biogen Idec Canada Inc., has updated the Tysabri product information with new information on Progressive Multifocal Leukoencephalopathy (PML). The risk of PML increases with increasing duration of treatment with Tysabri. After 24 infusions, physicians are to review with their patients, the benefits and risk of continuing Tysabri treatment.
Schröder A, Lee DH, Hellwig K, Lukas C, Linker RA, Gold R. **Successful Management of Natalizumab**-Associated Progressive Multifocal Leukoencephalopathy and Immune Reconstitution Syndrome in a Patient With Multiple Sclerosis. Arch Neurol. 2010 Jul 12.
Oct 22/10 - Two more patients taking Biogen Idec Inc's multiple sclerosis drug Tysabri (natalizumab) have developed progressive multifocal leukoencephalopathy (PML), the company said on Wednesday. The Cambridge, Massachusetts-based biotechnology company said in its latest monthly update that as of Oct. 1, there have been **70 confirmed cases of PML**, up from 68 as of Sept. 2. Of those, 14 have died and 56 are alive with varying degrees of disability ranging from mild to severe. There were no additional deaths in October. As of June 30, about 71,400 patients had received Tysabri since it was launched.
Vermersch P, Kappos L, Gold R, et al. Clinical outcomes of natalizumab-associated progressive multifocal leukoencephalopathy. Neurology. 2011 May 17;76(20):1697-704.
FDA Jan/12 JC virus is common and usually harmless, the agency said, but its presence — along with either of the other two PML risk factors — can be dangerous in patients taking immunomodulating drugs like natalizumab. The other risk factors are treatment with natalizumab for longer than 2 years, and previous treatment with immunosuppressant drugs such as methotrexate or cyclophosphamide. The FDA estimates that patients with all three risk factors face about a 1% risk for PML (11 cases per 1000 patients treated).

Krishnan C, Kaplin AI, Brodsky RA, et al. Reduction of Disease Activity and Disability With High-Dose Cyclophosphamide in Patients With Aggressive Multiple Sclerosis. Arch Neurol. 2008 Jun 9. [Epub ahead of print] Treatment with HiCy (50 mg/kg/d for 4 consecutive days) was safe and well tolerated in our patients with MS. Patients experienced (n=9) a pronounced reduction in disease activity and disability after HiCy treatment. This immunoablative regimen of cyclophosphamide for patients with aggressive MS is worthy of further study and may be an alternative to bone marrow transplantation.

Makhani N, Gorman MP, Branson HM, et al. **Cyclophosphamide** therapy in pediatric multiple sclerosis. Neurology. 2009 May 13. Cyclophosphamide is an option for the treatment of children with aggressive multiple sclerosis refractory to first-line therapies. Recommendations regarding patient selection, treatment administration, and monitoring are discussed.

[75] Casetta I ; Iuliano G ; Filippini G. **Azathioprine** for multiple sclerosis. **Cochrane** Database Syst Rev. 2007; (4):CD003982 (ISSN: 1469-493X) {Azathioprine is an appropriate maintenance treatment for patients with multiple sclerosis who frequently relapse and require steroids. Cumulative doses of 600 g should not be exceeded in relation to a possible increased risk of malignancy. Considering the trade off between the benefits and harms, azathioprine is a fair alternative to interferon beta for treating multiple sclerosis. A logical next step for future trials would seem the direct comparison of azathioprine and interferon beta. In fact the direct comparison between these two widely used treatments in multiple sclerosis has not been made.}

[76] **CAMMS223** Trial Investigators, Coles AJ, Compston DA, et al. **Alemtuzumab** vs. Interferon beta-1a in early multiple sclerosis. N Engl J Med. 2008 Oct 23;359(17):1786-801. In patients with early, relapsing-remitting multiple sclerosis, alemtuzumab was more effective than interferon beta-1a but was associated with autoimmunity, most seriously manifesting as immune thrombocytopenic purpura. The study was not powered to identify uncommon adverse events.

Cohen JA, Coles AJ, Arnold DL, et al, **CARE-MS I**. **Alemtuzumab** versus interferon beta 1a as fi rst-line treatment for patients with relapsing-remitting multiple sclerosis: a randomised controlled phase 3 trial. Lancet 2012. online Nov 1.

Coles AJ, Fox E, Vladic A, et al. Alemtuzumab more effective than interferon β-1a at **5-year follow-up of CAMMS223** Clinical Trial. Neurology. 2012 Apr 3;78(14):1069-78.

[77] Giovannoni G, Comi G, Cook S, et al. the **CLARITY** Study Group, A Placebo-Controlled Trial of Oral Cladribine for Relapsing Multiple Sclerosis. N Engl J Med 2010 0: NEJMoa0902533. (n=1326, 96 weeks, 3.5 or 5.25mg/kg)
For cladribine versus placebo, the relative risk reduction in the annualized relapse rate was 57.6% for the group receiving 3.5 mg per kilogram of body weight and 54.5% for those receiving 5.25 mg per kilogram. Adverse effects were similar in all three trials of cladribine and fingolimod, and rates of events leading to discontinuation of a study drug were low but still at least twice as frequent with high-dose cladribine (7.9% for the 5.25-mg dose) and fingolimod (10% and 14% for the 1.25-mg dose). Side effects: herpetic infections, ?cancer & lymphocytopenia.

Giovannoni G, Cook S, Rammohan K, et al; on behalf of the **CLARITY** study group. Sustained disease-activity-free status in patients with relapsing-remitting multiple sclerosis treated with **cladribine** tablets in the CLARITY study: a post-hoc and subgroup analysis. Lancet Neurol. 2011 Mar 10.

June 22/11, Merck Serono announced that, in light of feedback from regulatory authorities, the company would **no longer pursue a global approval process for cladribine tablets (Movectro)** for the treatment of relapsing-remitting MS & indeed would withdraw the drug from Australia and Russia, where it already had achieved approval.

Ciccone A, Beretta S, Brusaferri F, et al. **Corticosteroids** for the long-term treatment in multiple sclerosis. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD006264. There is no enough evidence that long-term corticosteroid treatment delays progression of long term disability in patients with MS. Since one study at high risk of bias showed that the administration of pulsed high dose i. v. MP is associated with a significant reduction in the risk of long term disability progression in patients with RR MS, an adequately powered, a quality RCT is needed to investigate this finding.

Clerico M, Faggiano F, Palace J, Rice G, Tintorè M, Durelli L. Recombinant **interferon beta** or glatiramer acetate for delaying conversion of the **first demyelinating event to multiple sclerosis**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD005278. The efficacy of IFN beta treatment on preventing the conversion from CIS to CDMS was confirmed over two years of follow-up. Since patients had some clinical heterogeneity (length of follow-up, clinical findings of initial attack), it could be useful for the clinical practice to further analyse the efficacy of IFN beta treatment in different patient subgroups.

FDA Dec/11 has received a report of a patient with multiple sclerosis (MS) who **died** within 24 hours of taking the first dose of **Gilenya (fingolimod).** At this time, FDA cannot conclude whether the drug resulted in the patient's death.

FDA May/12 warned clinicians on Thursday that "**liberation therapy**," an experimental procedure that uses angioplasty balloons or stents to open narrowed veins in the chest and neck, has not been approved to treat chronic cerebrospinal venous insufficiency (**CCSVI**) and could be dangerous. Liberation therapy has been associated with one death due to a brain hemorrhage and one stroke, says the FDA. Other possible risks include blood clots, cranial nerve damage, and migrating stents.

FDA is alerting the public that a patient in Europe diagnosed with possible multiple sclerosis (MS) has developed a rare and serious brain infection after taking the drug Gilenya (fingolimod). This is the first case of progressive multifocal leukoencephalopathy (**PML**), reported following the administration of **Gilenya** to a patient who had not previously received Tysabri (natalizumab), an MS drug associated with a higher risk of PML.

Filippini G, Del Giovane C, Vacchi L, D'Amico R, Di Pietrantonj C, Beecher D, Salanti G. **Immunomodulators and immunosuppressants for multiple sclerosis**: a **network meta-analysis**. Cochrane Database of Systematic Reviews 2013, Issue 6. Art. No.: CD008933. DOI: 10.1002/14651858.CD008933.pub2. Our review should provide some guidance to clinicians and patients. On the basis of high quality evidence, natalizumab and IFNß-1a (Rebif) are superior to all other treatments for preventing clinical relapses in RRMS in the short-term(24months) compared to placebo. Moderate quality evidence supports a protective effect of natalizumab and IFNß-1a (Rebif) against disability progression in RRMS in the short-termcompared to placebo. These treatments are associated with long-termserious adverse events and their benefit-risk balance might be unfavourable. IFNß-1b (Betaseron) and mitoxantrone probably decreased the odds of the participants with RRMS having relapses, compared with placebo (moderate quality of evidence). The benefit-risk balance with azathioprine is uncertain, however this agent might be effective in decreasing the odds of the participants with RRMS having relapses and disability progression over 24 to 36 months, compared with placebo. The lack of convincing efficacy data shows that IFNß-1a (Avonex), intravenous immunoglobulins, cyclophosphamide and long-term steroids have an unfavourable benefit-risk balance in RRMS. None of the included treatments are effective in decreasing disability progression in patients with progressive MS. It is important to consider that the clinical effects of all these treatments beyond two years are uncertain, a relevant point for a disease of 30 to 40 years duration. Direct head-to-head comparison(s) between natalizumab and IFNß-1a (Rebif) or between azathioprine and IFNß-1a (Rebif) should be top priority on the research agenda and follow-up of the trial cohorts should be mandatory.

Kappos L, et al. Long-term subcutaneous interferon beta-1a therapy in patients with relapsing-remitting MS. (PRISMS) study Neurology. 2006 Sep 26;67(6):944-53. Despite the limitations inherent in any long-term study (for example, potential differences between returning and nonreturning patients), these results indicate that patients with relapsing-remitting multiple sclerosis can experience sustained benefit over many years from early interferon beta-1a subcutaneous therapy three times weekly compared with patients whose treatment is delayed. This effect was more apparent in the patients receiving the higher dose.
Kappos L, et al.; FTY720 D2201 Study Group. Oral fingolimod (FTY720) for relapsing multiple sclerosis. N Engl J Med. 2006 Sep 14;355(11):1124-40.

Kuhle J, Pohl C, Mehling M, et al. Lack of association between antimyelin antibodies and progression to multiple sclerosis. N Engl J Med. 2007 Jan 25;356(4):371-8. Presence of anti-MOG or anti-MBP or both was not significantly associated with conversion to CDMS in our CIS cohort. However, patients with anti-myelin oligodendrocyte glycoprotein (anti-MOG) and anti-myelin basic protein antibodies (anti-MBP) had higher lesion load & more disseminated lesions in cranial MRI as well as higher values for CSF leucocytes and intrathecal IgG production. Our data support a correlation of anti-MOG & anti-MBP to inflammatory signs in MRI & CSF. The prognostic value of these antibodies for CDMS, seems to be less pronounced than previously reported.

Evidence Report: The efficacy and safety of **mitoxantrone** (Novantrone) in the treatment of multiple sclerosis: Report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology (AAN) . Neurology. 2010 May 4;74(18):1463-70. http://www.neurology.org/cgi/reprint/74/18/1463

The accumulated Class III and IV evidence suggests an increased incidence of systolic dysfunction and therapy-related acute leukemia (TRAL) with mitoxantrone therapy. Systolic dysfunction occurs in approximately 12% of patients with MS treated with mitoxantrone, congestive heart failure occurs in approximately 0.4%, and leukemia occurs in approximately 0.8%. The number needed to harm is 8 for systolic dysfunction and 123 for TRAL.

NICE: National Institute for Health and Clinical Excellence**. Natalizumab** for the treatment of adults with highly active relapsing-remitting multiple sclerosis. London (UK): National Institute for Health & Clinical Excellence (NICE); 2007 Aug. 21 p. (Technology appraisal guidance; no. 127). Natalizumab is recommended as an option for the treatment only of rapidly evolving severe relapsing–remitting multiple sclerosis (RES). RES is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI. People currently receiving natalizumab, but for whom treatment would not have been recommended according to the above section of this guidance, should have the option to continue therapy until they and their clinicians consider it appropriate to stop.

Pucci E, Giuliani G, Solari A, Simi S, Minozzi S, Di Pietrantonj C, Galea I. **Natalizumab** for relapsing remitting multiple sclerosis. Cochrane Database of Systematic Reviews 2011, Issue 10. Art. No.: CD007621. DOI: 10.1002/14651858.CD007621.pub2. Although one trial did not contribute to efficacy results due to its duration, we found robust evidence in favour of a reduction in relapses and disability at 2 years in RRMS patients treated with NTZ. The drug was well tolerated. There are current significant safety concerns due to reporting of an increasing number of PML cases in patients treated with NTZ. This review was unable to provide an up-to-date systematic assessment of the risk due to the maximum 2 year-duration of the trials included. An independent systematic review of the safety profile of NTZ is warranted. NTZ should be used only by skilled neurologists in MS centres under surveillance programs.

NORdic trial of oral Methylprednisolone as add-on therapy to Interferon beta-1a for treatment of relapsing-remitting Multiple Sclerosis (**NORMIMS** study): a randomised, placebo-controlled trial. Lancet Neurol. 2009 Apr 29. [Epub ahead of print] Oral methylprednisolone given in pulses every 4 weeks as an add-on therapy to subcutaneous interferon beta-1a in patients with relapsing-remitting multiple sclerosis leads to a significant reduction in relapse rate. However, because of the small number of patients and the high dropout rate, these findings need to be corroborated in larger cohorts.

Approach to Migraine: Considerations

- ACUTE: - may consider metoclopramide or domperidone 1st; NSAID and/or triptan also recommended first line;
  - in very severe attacks, SC sumatriptan likely to be most effective & rapid; consider need for rapid onset vs recurrence, GI tolerance of po form, etc.
  - Link to Review Article in AFP Feb 2011: http://www.aafp.org/afp/2011/0201/p271.html
- PROPHYLAXIS: 1st line: beta-blockers (propranolol, metoprolol), TCAs, valproic acid, topiramate.
- MENSTRUAL Related Migraine (MRM): - severity may be increased; duration of headache may be longer and may be harder to treat than regular migraine
  - may consider NSAID or triptan for short-term treatment, several days before and during menstruation [20].

Agents not effective or too many side effects:

- SSRIs, clonidine, methylsergide, oxcarbazepine, melatonin

Linde M, Mulleners WM, Chronicle EP, et al. **Topiramate for the prophylaxis of episodic migraine** in adults. Cochrane Database Syst Rev. 2013 Jun 24;6:CD010610. Meta-analysis demonstrates that topiramate in a 100 mg/day dosage is effective in reducing headache frequency and reasonably well-tolerated in adult patients with episodic migraine. This provides good evidence to support its use in routine clinical management. More studies designed specifically to compare the efficacy or safety of topiramate versus other interventions with proven efficacy in the prophylaxis of migraine are needed.

Both BoNTA and DVPX significantly reduced disability associated with migraine; BoNTA had a favorable tolerability profile compared with DVPX.

Naumann M, So Y, Argoff CE, Childers MK, Dykstra DD, Gronseth GS, Jabbari B, Kaufmann HC, Schurch B, Silberstein SD, Simpson DM; Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Assessment: Botulinum neurotoxin in the treatment of autonomic disorders and pain (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 May 6;70(19):1707-14. Botulinum neurotoxin (BoNT) should be offered as a treatment option for the treatment of axillary hyperhidrosis and detrusor overactivity (Level A), should be considered for palmar hyperhidrosis, drooling, and detrusor sphincter dyssynergia after spinal cord injury (Level B), and may be considered for gustatory sweating and low back pain (Level C). BoNT is probably ineffective in episodic migraine and chronic tension-type headache (Level B). There is presently no consistent or strong evidence to permit drawing conclusions on the efficacy of BoNT in chronic daily headache (mainly transformed migraine) (Level U). While clinicians' practice may suggest stronger recommendations in some of these indications, evidence-based conclusions are limited by the availability of data.

[18] Linde K, Streng A, Jurgens S, et al. Acupuncture for patients with migraine: a randomized controlled trial. JAMA. 2005 May 4;293(17):2118-25. . (InfoPOEMs: Acupuncture and sham acupuncture are equally more effective than no treatment in patients with migraine headaches. These results defend the adage that doing something is better than doing nothing. (LOE = 1b)). & Coeytaux RR, Kaufman JS, Kaptchuk TJ, et al. A randomized, controlled trial of **acupuncture** for chronic daily headache. Headache. 2005 Oct;45(9):1113-23.

Linde K, Allais G, Brinkhaus B, Manheimer E, Vickers A, White AR. **Acupuncture** for migraine prophylaxis. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD001218. In the previous version of this review, evidence in support of acupuncture for migraine prophylaxis was considered promising but insufficient. Now, with 12 additional trials, there is consistent evidence that acupuncture provides additional benefit to treatment of acute migraine attacks only or to routine care. There is no evidence for an effect of 'true' acupuncture over sham interventions, though this is difficult to interpret, as exact point location could be of limited importance. Available studies suggest that acupuncture

is at least as effective as, or possibly more effective than, prophylactic drug treatment, and has fewer adverse effects. Acupuncture should be considered a treatment option for patients willing to undergo this treatment.
Jena S, Witt CM, Brinkhaus B, Wegscheider K, Willich SN. Acupuncture in patients with headache. Cephalalgia. 2008 Sep;28(9):969-79. Epub 2008 Jul 8. Acupuncture plus routine care in patients with headache was associated with marked clinical improvements compared with routine care alone.

Jafarian S, et al. Gabapentin for prevention of **hypobaric hypoxia-induced headache**: randomized double-blind clinical trial. J Neurol Neurosurg Psychiatry. 2008 Mar;79(3):321-3. Epub 2007 Oct 26.

Linde M, Mulleners WM, Chronicle EP, et al. **Gabapentin or pregabalin for the prophylaxis of episodic migraine in adults.** Cochrane Database Syst Rev. 2013 Jun 24;6:CD010609. doi: 10.1002/14651858.CD010609. The pooled evidence derived from trials of gabapentin suggests that it is not efficacious for the prophylaxis of episodic migraine in adults. Since adverse events were common among the gabapentin-treated patients, it is advocated that gabapentin should not be used in routine clinical practice. Gabapentin enacarbil is not efficacious for the prophylaxis of episodic migraine in adults. There is no published evidence from controlled trials of pregabalin for the prophylaxis of episodic migraine in adults.

55. Detsky ME, et al. Does this patient with headache have a **migraine** or **need neuroimaging**? JAMA. 2006 Sep 13;296(10):1274-83. The best predictors can be summarized by the mnemonic POUNDing (Pulsating, duration of 4-72 hOurs, Unilateral, Nausea, Disabling). The presence of 4 simple historical features can accurately diagnose migraine. Several individual clinical features were found to be associated with a significant intracranial abnormality, and patients with these features should undergo neuroimaging. (InfoPOEMs: Useful clinical criteria from the history and physical for distinguishing migraine from tension-type headache include: nausea, photophobia, phonophobia, and exacerbation by physical activity. Combined findings useful for distinguishing migraine can be summarized by the mnemonic: POUNDing (Pulsatile quality; duration of 4 to 72 hOurs; Unilateral location; Nausea or vomiting; Disabling intensity). Patients with 4 or more of these criteria are most likely to have migraine headaches. Criteria increasing the risk of intracranial pathology include: cluster-type headache; abnormal neurologic examination result; undefined headache; headache with aura; headache aggravated by exertion or valsalva-like maneuver; and headache with vomiting. No clinical features from the history and physical are useful for significantly reducing the likelihood of intracranial pathology. (LOE = 3a))

66. Brandes JL, Kudrow D, Stark SR, et al. Sumatriptan-naproxen for the acute treatment of migraine: A randomized trial. JAMA 2007;297:1443-1454. {InfoPOEMs Jun07: A single-tablet combination of sumatriptan (85 mg) plus naproxen sodium (500 mg) was better than either agent alone in the treatment of acute migraine. Outcomes measured included 2-hour headache relief and 24-hour sustained pain-free response. This fixed combination is currently under FDA review and will be marketed under the trade name Trexima. This study used a single pill combination, but separate pills taken concurrently are likely to be equally efficacious (and potentially less expensive as generics). {LOE = 1b-}}

78. Bigal M, Sheftell F, Tepper S, Tepper D, Ho TW, Rapoport A. A randomized double-blind study comparing **rizatriptan, dexamethasone**, and the combination of both in the acute treatment of **menstrually related migraine**. Headache. 2008 Oct;48(9):1286-93. Rizatriptan is an effective treatment for MRM. RI+DE is significantly more effective than RI alone, although is associated with higher rate of adverse events.The combination should be considered for subjects with high disability, incomplete relief, or recurrence of pain with triptan monotherapy.The use of DE alone in the treatment of MRM is not justified based on our data.
79. Linde K, Allais G, Brinkhaus B, Manheimer E, Vickers A, White AR. **Acupuncture** for migraine prophylaxis. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD001218. In the previous version of this review, evidence in support of acupuncture for migraine prophylaxis was considered promising but insufficient. Now, with 12 additional trials, there is consistent evidence that acupuncture provides additional benefit to treatment of acute

migraine attacks only or to routine care. There is no evidence for an effect of 'true' acupuncture over sham interventions, though this is difficult to interpret, as exact point location could be of limited importance. Available studies suggest that acupuncture is at least as effective as, or possibly more effective than, prophylactic drug treatment, and has fewer adverse effects. Acupuncture should be considered a treatment option for patients willing to undergo this treatment.

80. Linder SL, Mathew NT, Cady RK, Finlayson G, Ishkanian G, et al. Efficacy and tolerability of **almotriptan in adolescents**: a randomized, double-blind, placebo-controlled trial. Headache. 2008 Oct;48(9):1326-36. Epub 2008 May 14. Oral almotriptan was efficacious for relieving migraine headache pain in adolescents, with the 12.5-mg dose associated with the most favorable efficacy profile with respect to relieving headache pain and associated symptoms of migraine (photophobia and phonophobia). Almotriptan treatment was well tolerated in this adolescent population.

Derry S, Moore RA, McQuay HJ. Paracetamol (**acetaminophen**) with or without an antiemetic for acute migraine headaches in adults. Cochrane Database Syst Rev. 2010 Nov 10;11:CD008040. Paracetamol 1000 mg alone is an effective treatment for acute migraine headaches, and the addition of 10 mg metoclopramide gives short-term efficacy equivalent to oral sumatriptan 100 mg. Adverse events with paracetamol did not differ from placebo; ``major`` adverse events were slightly more common with sumatriptan than with paracetamol plus metoclopramide.

Derry S, Moore RA. Paracetamol (**acetaminophen**) with or without an antiemetic for acute migraine headaches in adults. Cochrane Database Syst Rev. 2013 Apr 30;4:CD008040. Paracetamol 1000 mg alone is statistically superior to placebo in the treatment of acute migraine, but the NNT of 12 for pain-free response at two hours is inferior to at of other commonly used analgesics. Given the low cost and wide availability of paracetamol, it may be a useful first choice drug for acute migraine in those with contraindications to, or who cannot tolerate, non-steroidal anti-inflammatory drugs (NSAIDs) or aspirin. The addition of 10 mg metoclopramide gives short-term efficacy equivalent to oral sumatriptan 100 mg. Adverse events with paracetamol did not differ from placebo; serious and/or severe adverse events were slightly more common with sumatriptan than with paracetamol plus metoclopramide.

203. Kirthi V, Derry S, Moore RA. **Aspirin with or without an antiemetic** for acute migraine headaches in adults. Cochrane Database Syst Rev. 2013 Apr 30;4:CD008041. doi: 10.1002/14651858.CD008041.pub3. We found no new studies since the last version of this review. Aspirin 1000 mg is an effective treatment for acute migraine headaches, similar to sumatriptan 50 mg or 100 mg. Addition of metoclopramide 10 mg improves relief of nausea and vomiting. Adverse events were mainly mild and transient, and were slightly more common with aspirin than placebo, but less common than with sumatriptan 100 mg.

207. Derry S, Rabbie R, Moore RA. **Diclofenac with or without an antiemetic** for acute migraine headaches in adults. Cochrane Database Syst Rev. 2013 Apr 30;4:CD008783. doi: 10.1002/14651858.CD008783.pub3 Oral diclofenac potassium 50 mg is an effective treatment for acute migraine, providing relief from pain and associated symptoms, although only a minority of patients experience pain-free responses. Adverse events are mostly mild and transient and occur at the same rate as with placebo.
208. Kruit MC, Thijs RD, Ferrari MD, et al. **Syncope and orthostatic intolerance** increase risk of brain lesions in migraineurs and controls. Neurology. 2013 May 21;80(21):1958-1965.
209. Rabbie R, Derry S, Moore RA. **Ibuprofen with or without an antiemetic** for acute migraine headaches in adults. Cochrane Database Syst Rev. 2013 Apr 30;4:CD008039. doi: 10.1002/14651858.CD008039.pub3. We found no new studies since the last version of this review. Ibuprofen is an effective treatment for acute migraine headaches, providing pain relief in about half of sufferers, but complete relief from pain and associated symptoms for only a minority. NNTs for all efficacy outcomes were better with 400 mg than 200 mg in comparisons with placebo, and soluble formulations provided more rapid relief. Adverse events were mostly mild and transient, occurring at the same rate as with placebo.
210. Shamliyan TA, Kane RL, Taylor FR.. **Migraine in adults: Preventive** pharmacologic treatments. AHRQ Comparative Effectiveness Review. Rockville (MD): Agency for Healthcare Research and Quality (US); 2013 Apr. Report No.: 13-EHC068-EF. For chronic migraine, onabotulinumtoxin A reduced migraine attacks but increased the risk of adverse effects and treatment discontinuation due to adverse effects. For episodic migraine, approved drugs are effective but increase risk of adverse effects and treatment discontinuation due to adverse effects. Some off-label beta blockers and angiotensin inhibiting drugs are effective without bothersome harms and therefore offer the best benefits-to-harms ratio. We could not determine the long-term (i.e., trials of more than 3 months' duration), preventive benefits and adherence with drugs. Evidence on improving quality of life was

inconsistent across individual drugs. Evidence for individualized treatment decisions is very limited. Future research should examine the role of patient characteristics on drug benefits and safety.

215. Arevalo-Rodriguez I, Ciapponi A, et al. Posture and fluids for preventing **post-dural puncture headache**. Cochrane Database of Systematic Reviews 2013, Issue 7. Art. No.: CD009199. DOI:10.1002/14651858.CD009199.pub2. There is no evidence from RCTs that suggests that routine bed rest after dural puncture is beneficial for the prevention of PDPH onset. The role of fluid supplementation in the prevention of PDPH remains unclear.
216. Linde M, Mulleners WM, Chronicle EP, McCrory DC. **Antiepileptics other than gabapentin, pregabalin, topiramate, and valproate for the prophylaxis** of episodic migraine in adults. Cochrane Database Syst Rev. 2013 Jun 24;6:CD010608. Available evidence does not allow robust conclusions regarding the efficacy of antiepileptic drugs other than gabapentin,pregabalin, topiramate, and valproate in the prophylaxis of episodic migraine among adults. Acetazolamide, carisbamate, clonazepam, lamotrigine, oxcarbazepine, and vigabatrin were not more effective than placebo in reducing headache frequency. In one trial each, carbamazepine and levetiracetam were significantly superior to placebo in reducing headache frequency, and there was no significant difference in proportion of responders between zonisamide and active comparator.
217. DeVries A et al. CT scan utilization patterns in pediatric patients with recurrent headache. Pediatrics 2013 Jul; 132:e1.
218. Linde M, Mulleners WM, Chronicle EP, et al. **Topiramate for the prophylaxis of episodic migraine** in adults. Cochrane Database Syst Rev. 2013 Jun 24;6:CD010610. Meta-analysis demonstrates that topiramate in a 100 mg/day dosage is effective in reducing headache frequency and reasonably well-tolerated in adult patients with episodic migraine. This provides good evidence to support its use in routine clinical management. More studies designed specifically to compare the efficacy or safety of topiramate versus other interventions with proven efficacy in the prophylaxis of migraine are needed.

Alternative Therapies: behavioural therapies include the mastery of relaxation techniques, cognitive behavioural therapy including stress management, biofeedback, and the mastery of pacing and self monitoring skills

Patient Factors	**Red Flags for Serious Headaches**[17] "This is the worst headache ever…"
Age of onset	middle-aged to elderly patients
Type of onset	severe & abrupt; presents suddenly "like a thunderclap"
Temporal sequence	progressive severity or increased frequency
Pattern	significant change in headache pattern
Neurologic signs	stiff neck, focal signs, reduced consciousness
Systemic signs	fever, appears sick, abnormal exam, myalgias, weight loss
Caution: If headache does not fit typical pattern, a serious diagnosis can be missed.	

The **diagnosis of migraine** is clinically based upon a compatible history, physical examination, and fulfillment of diagnostic criteria.
Gold Standard for Diagnosis: The International Classification of Headache Disorders (2nd ed.)[18]
http://www.ihs-headache.org/upload/ct_clas/ihc_II_main_no_print.pdf

How to distinguish a migraine from other headache types?[19]
Findings suggest that the best criteria differentiating migraine with other headache types are the presence of nausea and/or vomiting in combination with 2 of the following 3 symptoms: photophobia[light], phonophobia[loud noises], and osmophobia[odour] *{see no evil, hear no evil, smell no evil}*

Different types of headache
1° migraine (included hormone related) with or without aura, tension-type headache, cluster headache & other trigeminal autonomic cephalgias, others (cough, exertion, etc…)
2° attributed to head and/or neck trauma, attributed to a substance or its withdrawal, attributed to a psychiatric disorder, etc…

Clinical Features of Migraine
Many patients with chronic migraine have a pattern of daily or near-daily headaches of low to moderate severity, associated with less prominent migrainous features. Superimposed on this baseline are exacerbations of pain with more prominent migrainous features such as photophobia, phonophobia, osmophobia, nausea, vomiting, and cutaneous allodynia (ie, the perception of pain produced by innocuous stimulation of normal skin).

ER setting[20]
- Use parenteral NSAIDS, sumatriptan, metoclopramide, or neuroleptics for initial symptom control
- Consider dihydroergotamine for severe cases
- Dexamethasone for possible prophylaxis against recurrence

Stowe R, Ives Nj, Clarke C et al. **Dopamine agonist therapy in early Parkinson's disease. Cochrane** Database Syst Rev. 2008 Apr 16;(2):CD006564. This meta-analysis confirms that motor complications are reduced with dopamine agonists compared to levodopa, but also establishes that other important side-effects are increased and symptom control is poorer with agonists. Larger, long-term comparative trials assessing patient-rated quality of life are needed to assess more reliably the balance of benefits and risks of dopamine agonists compared to levodopa.

[51] Pinero A, Marcos-Alberca P, Fortes J. **Cabergoline**-related severe restrictive mitral regurgitation. N Engl J Med. 2005 Nov 3;353(18):1976-7. (Concern because reports of drug being abused: may prolong orgasms in men) (Yamamoto M, Uesugi T, Nakayama T. Dopamine agonists and cardiac **valvulopathy** in Parkinson disease: a case-control study. Neurology. 2006 Oct 10;67(7):1225-9. The frequency of valvulopathy was significantly increased in the cabergoline group. Our results indicate that high cumulative dose and long-term treatment with cabergoline are risk factors for valvulopathy in patients with Parkinson disease. & Junghanns S, Fuhrmann JT, et al. **Valvular heart disease** in Parkinson's disease patients treated with dopamine agonists: A reader-blinded monocenter echocardiography study. Mov Disord. 2006 Nov 8; [Epub ahead of print] Our data suggest that ergot DAs are associated with higher prevalence of VHD compared to non-ergot DAs and controls. Standard echocardiography seems sufficient to detect VHD in PD patients treated with DAs.) (Schade R, Andersohn F, Suissa S, et al. Dopamine agonists and the risk of cardiac-valve regurgitation. N Engl J Med 2007; 356:29-38. (InfoPOEMs: The risk of cardiac valve damage is elevated in patients taking pergolide (Permax) or cabergoline (Dostinex), especially if the dose is higher than 3 mg per day and the drug is taken for more than 6 months. The absolute risk is modest: approximately 2.5 additional cases of valve damage for every 1000 patients who take one of the drugs for 1 year. (LOE = 3b))

Zanettini R, Antonini A, Gatto G, et al. Valvular heart disease and the use of dopamine agonists for Parkinson's disease. N Engl J Med 2007; 356:39-46. Roth BL. Drugs and valvular heart disease. N Engl J Med 2007; 356:6-9. According to a Perspective accompanying the two studies, the new findings support prior clinical and mechanistic evidence for a link between a histologically distinct fibrotic valvulopathy and treatment with drugs that block the serotonin receptor 5-hydroxytryptamine 2B (5-HT2B). Pergolide and cabergoline have that biochemical action in common, while the other studied dopamine antagonists don't have significant effects on **5-HT2B**.)

FDA Drug Safety Communication: Ongoing Safety Review of **Stalevo** (entacapone/carbidopa/levodopa) and possible development of **Prostate Cancer** in **STRIDE-PD** trial. Mar/10 http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/ucm206363.htm In that trial, 3.7% of pts taking Stalevo developed prostate cancer over a mean follow-up of 2.7 years, compared with 0.9% of patients taking carbidopa/levodopa (Sinemet) (odds ratio, 4.2). Previous trials of Stalevo and Comtan (entacapone) did not find an association with prostate cancer. FDA Drug Safety Communication Aug/10 : Patients taking **Stalevo** (carbidopa/levodopa plus entacapone) for Parkinson disease might be at greater risk for **cardiovascular events** than those taking Sinemet (carbidopa/levodopa), according to the FDA. The agency conducted a meta-analysis after the STRIDE-PD trial found a higher rate of myocardial infarction in patients using Stalevo. The meta-analysis of 15 clinical trials found an association between Stalevo and cardiovascular events (relative risk, 2.46), but the results were no longer significant after excluding the STRIDE-PD data.

FDA Sep/12 notified healthcare profesionals about a possible increased risk of **heart failure with Mirapex (pramipexole)**. Results of recent studies suggest a potential risk of heart failure that needs further review of available data.

Poewe WH, Rascol O, Quinn N, Tolosa E, Oertel WH, Martignoni E, Rupp M, Boroojerdi B; SP 515 Investigators. Efficacy of pramipexole and transdermal rotigotine in advanced Parkinson's disease: a double-blind, double-dummy, randomised controlled trial. Lancet Neurol. 2007 Jun;6(6):513-20. 204 patients were randomly assigned to receive **rotigotine** (up to 16mg per day), 201 to receive **pramipexole** (up to 4.5mg per day), and 101 to receive placebo for 6 months. In terms of change in absolute off time, rotigotine was non-inferior to pramipexole. Continuous delivery of rotigotine as transdermal patches could offer similar efficacy to oral pramipexole in patients with fluctuating Parkinson's disease over 6 months of treatment.

Stowe R, Ives N, Clarke CE, Deane K; et al. Evaluation of the efficacy and safety of **adjuvant treatment to levodopa therapy** in Parkinson s disease patients with motor complications. Cochrane Database Syst Rev. 2010 Jul 7;7:CD007166. Compared to placebo, adjuvant therapy reduces off-time, levodopa dose, and improves UPDRS scores in PD patients who develop motor complications on levodopa therapy. However, this is at the expense of increased dyskinesia and numerous other side-effects. Indirect comparisons suggest that dopamine agonist therapy may be more effective than COMTI and MAOBI therapy, which have comparable efficacy. However, as indirect comparisons should be interpreted with caution, direct head-to-head randomised trials assessing the impact of these different drug classes on overall patient-rated quality of life are needed.

Zesiewicz, T. A., Sullivan, K. L., Arnulf, I., et al. **AAN Practice Parameter**: Treatment of **nonmotor symptoms of Parkin**son disease: Report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology 2010 74: 924-931.

Guidelines AAN:

Cheng EM, Tonn S, Swain-Eng R, et al.; For the American Academy of Neurology Parkinson Disease Measure Development Panel. **Quality improvement** in neurology: AAN Parkinson disease quality measures: Report of the Quality Measurement and Reporting Subcommittee of the American Academy of Neurology. Neurology. 2010 Nov 30;75(22):2021-2027. http://www.neurology.org/content/75/22/2021.full.pdf+html

Miyasaki JM, et al.; Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: evaluation and treatment of **depression, psychosis, and dementia** in Parkinson disease (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):996-1002. http://www.neurology.org/cgi/reprint/66/7/996 Screening tools are available for depression and dementia in patients with PD, but more specific validated tools are needed. There are no widely used, validated tools for psychosis screening in Parkinson disease (PD). Clozapine successfully treats psychosis in PD. Cholinesterase inhibitors are effective treatments for dementia in PD, but improvement is modest and motor side effects may occur.

Pahwa R, et al.; Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: treatment of Parkinson disease with **motor fluctuations and dyskinesia** (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):983-95. http://www.neurology.org/cgi/reprint/66/7/983 1. Entacapone and rasagiline should be offered to reduce off time (Level A). Pergolide, pramipexole, ropinirole, and tolcapone should be considered to reduce off time (Level B). Apomorphine, cabergoline, and selegiline may be considered to reduce off time (Level C). 2. The available evidence does not establish superiority of one medicine over another in reducing off time (Level B). Sustained release carbidopa/levodopa and bromocriptine may be disregarded to reduce off time (Level C). 3. Amantadine may be considered to reduce dyskinesia (Level C). 4. Deep brain stimulation of the STN may be considered to improve motor function and reduce off time, dyskinesia, and medication usage (Level C). There is insufficient evidence to support or refute the efficacy of DBS of the GPi or VIM nucleus of the thalamus in reducing off time, dyskinesia, or medication usage, or to improve motor function. 5. Preoperative response to levodopa predicts better outcome after DBS of the STN (Level B).

Suchowersky O, et al.; Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: **neuroprotective strategies and alternative** therapies for Parkinson disease (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):976-82. http://www.neurology.org/cgi/reprint/66/7/976 1. Levodopa does not appear to accelerate disease progression. 2. No treatment has been shown to be neuroprotective. 3. There is no evidence that vitamin or food additives can improve motor function in PD. 4. Exercise may be helpful in improving motor function. 5. Speech therapy may be helpful in improving speech volume. 6. No manual therapy has been shown to be helpful in the treatment of motor symptoms, although studies in this area are limited. Further studies using a rigorous scientific method are needed to determine efficacy of alternative therapies.

Suchowersky O, et al. Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: diagnosis and prognosis of **new onset Parkinson** disease (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):968-75. http://www.neurology.org/cgi/reprint/66/7/968 1. Early falls, poor response to levodopa, symmetry of motor manifestations, lack of tremor, and early autonomic dysfunction are probably useful in distinguishing other parkinsonian syndromes from Parkinson disease (PD). 2. Levodopa or apomorphine challenge and olfactory testing are probably useful in distinguishing PD from other parkinsonian syndromes. 3. Predictive factors for more rapid motor progression, nursing home placement, and shorter survival time include older age at onset of PD, associated comorbidities, presentation with rigidity and bradykinesia, and decreased dopamine responsiveness. Future research into methods for earlier and more accurate diagnosis of the disease and identification and clarification of predictive factors of rapid disease progression is warranted.

39. Rowan AJ, Ramsay RE, Collins JF, et al.; VA Cooperative Study 428 Group. New onset **geriatric epilepsy**: a randomized study of **gabapentin, lamotrigine, and carbamazepine**. Neurology. 2005 Jun 14;64(11):1868-73. CONCLUSIONS: The main limiting factor in patient retention was adverse drug reactions. Patients taking lamotrigine (LTG) or gabapentin (GBP) did better than those taking carbamazepine. Seizure control was similar among groups. LTG and GBP should be considered as initial therapy for older patients with newly diagnosed seizures.

52. Wiffen P, Collins S, McQuay H, Carroll D, Jadad A, Moore A. Anticonvulsant drugs for acute and chronic pain. Cochrane Database Syst Rev. 2005 Jul 20;(3):CD001133. CONCLUSIONS: Although anticonvulsants are used widely in chronic pain surprisingly few trials show analgesic effectiveness. Only one studied considered cancer pain. There is no evidence that anticonvulsants are effective for acute pain. In chronic pain syndromes other than trigeminal neuralgia, anticonvulsants should be withheld until other interventions have been tried. While gabapentin is increasingly being used for neuropathic pain the evidence would suggest that it is not superior to carbamazepine.
53. Pandya KJ, Morrow GR, Roscoe JA, et al. **Gabapentin** for hot flashes in 420 women with breast cancer: a randomised double-blind placebo-controlled trial. Lancet. 2005 Sep 3-9;366(9488):818-24. Gabapentin is effective in the control of hot flashes at a dose of 900 mg/day, but not at a dose of 300 mg/day. This drug should be considered for treatment of hot flashes in women with breast cancer. (InfoPOEMs: Women with a history of breast cancer may obtain some relief from hot flashes with 900 mg gabapentin daily. The 300 mg daily dose was not effective. (LOE = 1b-))

60. Prasad K, Al-Roomi K, Krishnan P, Sequeira R, Prasad K. Anticonvulsant therapy for **status epilepticus**. **Cochrane** Database Syst Rev. 2005 Oct 19;(4):CD003723. AUTHORS' CONCLUSIONS: Lorazepam is better than diazepam or phenytoin alone for cessation of seizures and carries a lower risk of continuation of status epilepticus requiring a different drug or general anaesthesia. Both lorazepam and diazepam are better than placebo for the same outcomes. In the treatment of premonitory seizures, diazepam 30 mg in an intrarectal gel is better than 20 mg for cessation of seizures without a statistically significant increase in adverse effects. Universally accepted definitions of premonitory, early, established and refractory status epilepticus are required.

78. Seizure control & treatment in pregnancy. Observations from the EURAP Epilepsy Pregnancy Registry. Neurology. 2005 Dec 28; CONCLUSIONS: The majority of patients with epilepsy maintain seizure control during pregnancy. The apparently higher risk of seizures among women treated with oxcarbazepine & the more frequent increases in drug load in the oxcarbazepine & lamotrigine cohorts prompts further studies on relationships with pharmacokinetic changes. Risks associated with status epilepticus appear to be lower than previously reported.

85. Gamble C, et al. A meta-analysis of individual patient responses to lamotrigine or carbamazepine monotherapy.Neurology. 2006 May 9;66(9):1310-7.
86. Meierkord H, et al. EFNS guideline on the management of status epilepticus. Eur J Neurol. 2006 May;13(5):445-50. The preferred treatment pathway for generalised convulsive status epilepticus (GCSE) is intravenous (i.v.) administration of 4 mg of lorazepam or 10 mg of diazepam directly followed by 15-18 mg/kg of phenytoin or equivalent fosphenytoin. If seizures continue for more than 10 min after first injection another 4 mg of lorazepam or 10 mg of diazepam is recommended. Refractory GCSE is treated by anaesthetic doses of midazolam, propofol or barbiturates; the anaesthetics are titrated against an electroencephalogram burst suppression pattern for at least 24 h. The initial therapy of non-convulsive SE depends on the type and the cause. In most cases of absence SE, a small i.v. dose of lorazepam or diazepam will terminate the attack. Complex partial SE is initially treated such as GCSE, however, when refractory further non-anaesthetising substances should be given instead of anaesthetics. In subtle SE i.v. anaesthesia is required.

89. Health Canada Aug/06 **Lamictal** warning with non-syndromic **oral clefts**. Emerging data from the North American Antiepileptic Drug (NAAED) Pregnancy Registry suggest an association between LAMICTAL and an increased risk of non-syndromic oral clefts over the reference population for the registry (ie. Active Malformations Surveillance Program at Brigham and Women's Hospital in Boston, USA)1. Recently published data from the Registry report three cases of isolated, non syndromic cleft palate and two cases of isolated, non syndromic cleft lip without cleft palate in infants from 564 first trimester lamotrigine monotherapy exposures giving a rate of 8.9 per 1,000, as compared to 0.37 per 1000 in the reference population for that registry. The prevalence of oral clefts noted in the NAAED registry is also higher than the background prevalence of non-syndromic oral clefts reported in the literature, including studies from the United States, Australia and Europe. While different studies have differing results due to geographic and case ascertainment variations, the reported range is 0.50 to 2.16/1000 3-17. To assist with the assessment of risk, analysis of data from additional pregnancy registries, with approximately 2200 additional lamotrigine monotherapy first trimester exposures has been conducted, and 4 additional non-syndromic cases of oral cleft have been identified.

Dolk H, Jentink J, Loane M, Morris J, de Jong-van den Berg LT; EUROCAT Antiepileptic Drug Working Group. Does lamotrigine use in pregnancy increase orofacial cleft risk relative to other malformations? Neurology. 2008 Sep 2;71(10):714-22. Epub 2008 Jul 23. We find no evidence of a specific increased risk of isolated orofacial clefts relative to other malformations due to lamotrigine (LTG) monotherapy. Our study is not designed to assess whether there is a generalized increased risk of malformations with LTG exposure.

Neurology. 2007 Oct 30;69(18):1751-60. Epub 2007 Jul 11. Adjunctive levetiracetam is an effective and well-tolerated antiepileptic drug for treating generalized tonic-clonic seizures in patients with idiopathic generalized epilepsies.

126. Johnson BA, Rosenthal N, Capece JA, et al, for the Topiramate for Alcoholism Advisory Board and the Topiramate for Alcoholism Study Group. Topiramate for alcohol dependence. A randomized controlled trial. JAMA 2007;298(14):1641-1651. {InfoPOEMs: Topiramate (Topamax) is somewhat more effective than placebo in helping adults with alcohol dependence reduce heavy drinking (number needed to treat [NNT] = 7) and achieve abstinence (NNT = 9). Unfortunately, less than one-third of the patients in the active treatment group significantly reduced their drinking compared with baseline amounts and less than one-fifth achieved continuous abstinence for 28 days or more. As a safety precaution, topiramate was discontinued after 14 weeks and no further follow up is reported. Thus, long-term efficacy remains unknown. (LOE = 1b)}
127. Marson AG, Al-Kharusi AM, Alwaidh M, et al; **SANAD** Study group. The SANAD study of effectiveness of valproate, lamotrigine, or topiramate for generalised and unclassifiable epilepsy: an unblinded randomised controlled trial. Lancet. 2007 Mar 24;369(9566):1016-26. Valproate is better tolerated than topiramate and more efficacious than lamotrigine, and should remain the drug of first choice for many patients with generalised and unclassified epilepsies. However, because of known potential adverse effects of valproate during pregnancy, the benefits for seizure control in women of childbearing years should be considered.
128. Marson AG, Al-Kharusi AM, Alwaidh M, et al. **SANAD** Study group. The SANAD study of effectiveness of carbamazepine, gabapentin, lamotrigine, oxcarbazepine, or topiramate for treatment of partial epilepsy: an unblended randomised controlled trial. Lancet. 2007 Mar 24;369(9566):1000-15. Lamotrigine is clinically better than carbamazepine, the standard drug treatment, for time to treatment failure outcomes and is therefore a cost-effective alternative for patients diagnosed with partial onset seizures.

138. Pack AM, Morrell MJ, Randall A, et al. Bone health in young women with epilepsy after one year of antiepileptic drug monotherapy. Neurology. 2008 Apr 29;70(18):1586-93. In contrast, those treated with carbamazepine, lamotrigine, and valproate did not have detectable adverse effects on bone turnover or bone mineral density. These results raise **concerns about the long-term effects of phenytoin monotherapy on bone** in young women with epilepsy.
139. Neal EG, Chaffe H, Schwartz RH, et al. The **ketogenic diet** for the treatment of childhood epilepsy: a randomised controlled trial. Lancet Neurol. 2008 Jun;7(6):500-6. Epub 2008 May 2. The results from this trial of the ketogenic diet support its use in children with treatment-intractable epilepsy.
140. Alvestad S, Lydersen S, Brodtkorb E. Cross-reactivity pattern of rash from current aromatic antiepileptic drugs. Epilepsy Res. 2008 May 17. [Epub ahead of print] LTG appears to be involved in cross-reactions less often than CBZ, OXC and PHT.
141. Woods SW, Saksa JR, Baker CB, Cohen SJ, Tek C. Effects of levetiracetam (0.5-3g/d) on **tardive dyskinesia**: a randomized, double-blind, placebo-controlled study. J Clin Psychiatry. 2008 Apr;69(4):546-54. (n=50 12+12 weeks) Levetiracetam appeared effective for TD in this study. The mechanisms of its therapeutic effect are unclear but may involve reducing neuronal hypersynchrony in basal ganglia.
142. LeLorier J, Duh MS, Paradis PE, Lefebvre P, Weiner J, Manjunath R, Sheehy O. Clinical consequences of generic substitution of lamotrigine for patients with epilepsy. Neurology. 2008 May 27;70(22 Pt 2):2179-86. A higher propensity to switch back to branded medications was observed among antiepileptic drug users compared to users of antihypertensives and antihyperlipidemics, similar to findings from Andermann et al. Switch to **generic lamotrigine** was significantly associated with increased physician visits and hospitalizations.
143. Johnson BA, Rosenthal N, et al.**Topiramate for Alcoholism** Advisory Board; Topiramate for Alcoholism Study Group. Improvement of physical health and quality of life of alcohol-dependent individuals with topiramate treatment: US multisite randomized controlled trial. Arch Intern Med. 2008 Jun 9;168(11):1188-99.
144. Hunt S, Russell A, Smithson WH, Parsons L, Robertson I, Waddell R, Irwin B, Morrison PJ, Morrow J, Craig J; UK Epilepsy and Pregnancy Register. **Topiramate** in pregnancy: preliminary experience from the UK Epilepsy and **Pregnancy Register**. Neurology. 2008 Jul 22;71(4):272-6. The number of outcomes of human pregnancies exposed to topiramate is low, but the major congenital malformation rate for topiramate polytherapy raises some concerns. Overall, the rate of oral clefts observed was 11 times the background rate. Although the present data provide new information, they should be interpreted with caution due to the sample size and wide confidence intervals.
FDA Mar/11 notified healthcare professionals and patients of an increased risk of development of cleft lip and/or cleft palate (oral clefts) in infants born to women treated with Topamax (topiramate) during pregnancy. Because of new human data that show an increased risk for oral clefts, topiramate is being placed in Pregnancy Category D.
145. Vestergaard M, Pedersen MG, Ostergaard JR, et al. Death in children with **febrile seizures**: a population-based cohort study. Lancet. 2008 Aug 9;372(9637):457-63. Long-term mortality is not increased in children with febrile seizures, but there seems to be a small excess mortality during the 2 years after complex febrile seizures. Parents should be reassured that death after febrile seizures is very rare, even in high-risk children.

Primidone and levetiracetam probably transfer into breast milk in clinically important amounts. Valproate, phenobarbital, phenytoin, and carbamazepine probably are not transferred into breast milk in clinically important amounts. Pregnancy probably causes an increase in the clearance and a decrease in the concentrations of lamotrigine, phenytoin, and, to a lesser extent carbamazepine, and possibly decreases the level of levetiracetam and the active oxcarbazepine metabolite, the monohydroxy derivative (MHD). Supplementing WWE with at least 0.4 mg of folic acid before pregnancy may be considered. Monitoring of lamotrigine, carbamazepine, and phenytoin levels during pregnancy should be considered, and monitoring of levetiracetam and oxcarbazepine (as MHD) levels may be considered.

Adverse Effect on:		Most; and Least Likely Agents
Brain	Cognition	Barbs, Benzos
	Coordination	Barbs, Benzos, CBZ Phenytoin; 2nd gen less so and least with Levetiracetam, Gabapentin
	Language	Topiramate
	Behavior, Personality	Barbs, Levetiracetam, Topiramate, Vigabatrin (+ psychiatric history increase risk)
Blood		CBZ, Phenytoin, Valproate
Bone		CBZ, Valproate
Liver, Pancreas		Valproate
Skin		CBZ, OxyCarb, Lamotrigine, Phenytoin (also related to Asian/genetics, age – Peds and Geriatrics, prior hx of skin rx, high initial dose or rapid dose esculation, immune system disorders, Herpes virus reactivation)
Weight (gain also associated with ↑ risk of CVD)		↑: Gabapentin, Pregabalin, Vigabatrin, Valproate, CBZ (moderate); ↓:Topiramate
Pregnancy		Barbs, Topiramate,Valproate; CBZ, Phenytoin, Lamotrigine
Female Hormones		Valproate (↑Polycystic Ovarian Syndrome and Hirsuitism in ♀);Levetiracetam least effect on OCs
Metabolic Enzyme **Induction** (**Increased** metabolic clearance of other substrates and reduced efficacy)		Barbs, CBZ, Phenytoin (reduce levels of antimicrobials, immunosuppressants, OCs, cardiovascular meds, psychotropics, antineoplastics, antiepileptics)
Metabolic Enzyme **Inhibition** (**Decreased** metabolic clearance of other substrates and increased/prolonged effects)		Valproate (TCAs, Barbs, Benzos, CBZ, lamotrigine, warfarin, zidovudine)

460. FDA Nov/13 Potiga (**Ezogabine**) -approved changes to the drug label, underscoring risks of abnormalities to the retina in the eye, potential vision loss, and skin discoloration, all of which may become permanent. The revised label includes a new boxed warning, because of the risk of abnormalities to the retina. FDA advises that Potiga use be limited to patients who have not responded adequately to several alternative therapies to decrease the frequency of seizures, or epilepsy, and for whom the benefits of treatment outweigh the risks.
461. Uceyler N, Sommer C, Walitt B, et al. **Anticonvulsants for fibromyalgia**. Cochrane Database Syst Rev. 2013 Oct 16;10:CD010782. The anticonvulsant, pregabalin, demonstrated a small benefit over placebo in reducing pain and sleep problems. Pregabalin use was shown not to substantially reduce fatigue compared with placebo. Study dropout rates due to adverse events were higher with pregabalin use compared with placebo. Dizziness was a particularly frequent adverse event seen with pregabalin use.

:

Further investigations for Special Circumstances

Bleeding Disorders- ↑ suspicion when initial onset of menses is heavy & regular bleeding patterns or presents with suggestive sx: postpartum hemorrhage; surgery-related bleeding, & bleeding associated with dental procedures; or frequent bruising, epistaxis, and bleeding gums. Further investigations: platelet count, PTT, INR, von Willebrand factor,& ristocetin factor

Peri-menopausal- consider endometrial sampling first line due to ↑ risk of endometrial hyperplasia/carcinoma in patients >45yrs or <45 WITH hx of unopposed estrogen exposure, failed medical management, or persistent AUB

Uterine Fibroids & AUB Treatment[32,33,34,35]

Uterine fibroids are commonly found in women in the middle to later reproductive years & are associated with symptoms such as heavy bleeding, menstrual pain, pressure in the lower abdomen, infertiliy, & recurrent miscarriages. Uterine fibroids are thought to be estrogen and progesterone dependent because they shrink after menopause. Traditionally treatment has been the surgical route (myomectomy or hysterectomy), but drug treatments are becoming more relevant:

Agents currently used for Uterine Fibroids

1. GnRH agonists: ↓ uterine fibroid size (by ≤50%) & ↓ uterine fibroid-related symptoms, but treatment restricted to 3-6 months due to hypoestrogenic AE & fibroids return to pretreatment size once agents are stopped
2. LNG-IUS MIRENA: ↓ menstrual blood loss related to uterine fibroids & ↑ hemoglobin in women with anemia, but is not beneficial for uterine regression
3. Ulipristal FIBRISTAL: selective progesterone receptor modulator; ↓ uterine fibroid volume (≤31% vs placebo ↑ 3%); controls bleeding & faster onset of amenorrhea (noninferior & more sustained effect than leuprolide acetate); no serious side effects

Agents in the Clinical Trial Pipeline for the indication of Uterine Fibroid Associated Abnormal Uterine Bleeding:

- Mifepristone MIFEPREX: competitively binds & antagonizes progesterone receptors; inconsistent evidence on effect of uterine size reduction (0 to 50%); ↑ endometrial hyperplasia with no atypia (unsure of clinical implications)
- Asoprisnil: selective progesterone receptor modulator with high receptor & tissue specificity; 25mg/day ↓ volume by ≤36%; ↓ bloating, pelvic pain, & uterine artery blood flow; minimal hypoestrogenic effects
- Telapristone PROELLEX: selective progesterone modulator; doses of 12.5, 25, & 50mg ↓ fibroid size by 10.6, 32.6, & 40.3% respectively (leuprolide acetate 32.6% & placebo 10.6% ↓)
- Aromatase inhibitors (letrozole, anastrozole, fadrozole): antiestrogen; ↓ size of fibroid & symptoms (menstrual volume, duration of menstruation, & dysmenorrhea); no serious side effects reported

Cheng L, et al. Interventions for emergency contraception. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD001324. Mifepristone middle dose (25-50 mg) was superior to other hormonal regimens. Mifepristone low dose (<25 mg) could be more effective than levonorgestrel 0.75 mg (two doses) but this was not conclusive. Levonorgestrel proved more effective than the Yuzpe regimen. The copper IUD was another effective emergency contraceptive that can provide ongoing contraception.

Cheng L, Che Y, Gulmezoglu AM. Interventions for **emergency contraception**. Cochrane Database Syst Rev. 2012 Aug 15;8:CD001324. Intermediate-dose mifepristone (25-50 mg) was superior to LNG and Yuzpe regimens. Mifepristone low dose (< 25 mg) may be more effective than LNG (0.75 mg two doses), but this was not conclusive. UPA may be more effective than LNG. LNG proved to be more effective than the Yuzpe regimen. The copper IUD was the most effective EC method and was the only EC method to provide ongoing contraception if left in situ.

Edelman AB, et al. Continuous oral contraceptives: are bleeding patterns dependent on the hormones given? Obstet Gynecol. 2006 Mar;107(3):657-65. CONCLUSION: The addition of 10 mug of ethinyl E2 to a 20 mug ethinyl E2 pill containing levonorgestrel or norethindrone acetate did not improve bleeding patterns. During continuous dosing, the use of oral contraceptives containing 1,000 mug norethindrone acetate resulted in more days of amenorrhea and fewer days of spotting than preparations containing 100 mug levonorgestrel.

FDA Oct/11 released the final report of an FDA-funded study looking into the risk for venous thromboembolism (VTE) in women taking oral contraceptives containing drospirenone. As previously reported by Medscape Medical News, on September 26 the FDA said preliminary findings from the study indicate that women who use **drospirenone-containing birth control pills have an approximately 1.5-fold increase** in the risk of developing blood clots relative to women using other types of hormonal contraceptives.

FDA Drug Safety Communication Sept/11: Safety review update on the possible increased risk of blood clots with birth control pills containing drospirenone. http://www.fda.gov/Drugs/DrugSafety/ucm273021.htm (Accessed November 29th, 2011).

FDA Apr/12 has completed its review of recent observational (epidemiologic) studies regarding the risk of blood clots in women taking drospirenone-containing birth control pills.Based on this review, FDA has concluded that **drospirenone**-containing birth control pills may be associated with a higher risk for blood clots than other progestin-containing pills. . Report that some epidemiologic studies reported as high as a three-fold increase in the risk of blood clots for drospirenone-containing products when compared to products containing levonorgestrel or some other progestins, whereas other epidemiological studies found no additional risk of blood clots with drospirenone-containing products.

Loder EW, et al. **Headache** as a side effect of combination estrogen-progestin oral contraceptives: a systematic review. Am J Obstet Gynecol. 2005 Sep;193(3 Pt 1):636-49. (InfoPOEMs: There is not a clearly documented causal relationship between headaches and oral contraceptives (OCs). Headaches that patients attribute to initiation of OCs tend to improve over time. There is no evidence to support change of formulation to manage headache. Manipulation of estrogen withdrawal has not been sufficiently studied. (LOE = 1a-))

Loder EW, Buse DC, Golub JR. **Headache** and combination estrogen-progestin oral contraceptives: integrating evidence, guidelines, and clinical practice. Headache. 2005 Mar;45(3):224-31.

Lopez LM, Newmann SJ, Grimes DA, Nanda K, Schulz KF. **Immediate start** of hormonal contraceptives for contraception. *Cochrane Database Syst Rev.* 2008;(2):CD006260.

Lopez LM, et al. **Skin patch and vaginal ring versus combined oral contraceptives** for contraception. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD003552. Effectiveness rates were similar for the methods compared. The patch group had better compliance than the COC group. Compared to COC users, patch users had more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge. The patch could lead to more discontinuation while the vaginal ring showed little difference. High losses to follow up can affect the validity of the results.

Lopez LM, Grimes DA, Chen-Mok M, et al. Hormonal contraceptives for **contraception in overweight or obese women**. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008452. Body weight addresses overall body size, while BMI generally reflects the amount of fat. Only one of three studies using BMI found a higher pregnancy risk for overweight women. The efficacy of implants and injectable contraceptives may be unaffected by body mass. The field could use trials of contraceptive methods with groups stratified by BMI. The current evidence on effectiveness by BMI is limited. However, the contraceptive methods examined here are still among the most effective when the recommended regimen is followed.

Lopez LM, Edelman A, Chen-Mok M, Trussell J, Helmerhorst FM. **Progestin-only contraceptives: effects on weight**. Cochrane Database Syst Rev. 2011 Apr 13;4:CD008815. We found little evidence of weight gain when using POCs. Mean gain was less than 2 kg for most studies up to 12 months, and usually similar for the comparison group using another contraceptive.

Lopez LM, Hiller JE, Grimes DA, et al. **Education** for contraceptive use by women after childbirth. Cochrane Database Syst Rev. 2012 Aug 15;8:CD001863. The overall quality of evidence was moderate. Half of these postpartum interventions led to fewer repeat pregnancies or births or more contraceptive use.

Lopez L, et al. Oral contraceptives containing **drospirenone for premenstrual syndrome**. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD006586. Drospirenone plus EE 20 mug may help treat premenstrual symptoms in women with PMDD.

Lopez LM, Grimes DA, Gallo MF, Schulz KF. Skin patch and **vaginal ring versus combined oral contraceptives** for contraception. Cochrane Database Syst Rev. 2010 Mar 17;3:CD003552. Effectiveness was similar for the methods compared. The patch could lead to more discontinuation while the vaginal ring showed little difference. The patch group had better compliance than the COC group but more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge.

Lopez LM, Edelman A, Chen-Mok M, et al. **Progestin-only contraceptives: effects on weight**. Cochrane Database Syst Rev. 2011 Apr 13;4:CD008815. We found little evidence of weight gain when using POCs. Mean gain was less than 2 kg for most studies up to 12 months, and usually similar for the comparison group using another contraceptive. Appropriate counseling about typical weight gain may help reduce discontinuation of contraceptives due to perceptions of weight gain.

Lopez LM, Newmann SJ, Grimes DA, et al. **Immediate start of hormonal contraceptives** for contraception. Cochrane Database Syst Rev. 2012 Dec 12;12:CD006260. doi: 10.1002/14651858.CD006260.pub3. We found limited evidence that immediate start of hormonal contraception reduces unintended pregnancies or increases method continuation. However, the pregnancy rate was lower with immediate start of DMPA versus another method.

Lopez LM, Stockton LL, ChenM, SteinerMJ, GalloMF. **Behavioral interventions for improving dual-method contraceptive use**. Cochrane Database of Systematic Reviews 2014, Issue 3. Art. No.: CD010915. DOI: 10.1002/14651858.CD010915.pub2. We found few behavioral interventions for improving dual-method contraceptive use and little evidence of effectiveness. Amultifaceted program showed some effect but only had self-reported outcomes. Two trials were more applicable to clinical settings and had objective outcomesmeasures, but neither showed any effect.The included studies had adequate information on intervention fidelity and sufficient follow-up periods for change to occur.

Noé G, Croxatto HB, Salvatierra AM, et al. Contraceptive efficacy of emergency contraception with **levonorgestrel** given before or after ovulation. Contraception. 2011 Nov;84(5):486-92. The efficacy of LNG-EC has been overestimated in studies using presumptive menstrual cycle data. Our results confirm previous similar studies and demonstrate that LNG-EC does not prevent embryo implantation and therefore cannot be labeled as abortifacient. …when used after ovulation has occurred, the number of observed and expected pregnancies is not statistically different, indicating that no reproductive process subsequent to ovulation is interfered with by LNG-EC….In conclusion, LNG-EC is highly effective for preventing unintended pregnancy when it is used before ovulation, but when used after ovulation, it is completely unable to prevent pregnancy because it has no effect on subsequent reproductive processes, including implantation of the embryo.

Van Vliet HA, Grimes DA, Lopez LM, et al. **Triphasic versus monophasic** oral contraceptives for contraception. Cochrane Database Syst Rev. 2011 Nov 9;11:CD003553. The available evidence is insufficient to determine whether triphasic OCs differ from monophasic OCs in effectiveness, bleeding patterns or discontinuation rates. Therefore, we recommend monophasic pills as a first choice for women starting OC use. Large, high-quality RCTs that compare triphasic and monophasic OCs with identical progestogens are needed to determine whether triphasic pills differ from monophasic OCs.
Westhoff C, et al. Initiation of Oral Contraceptives Using a **Quick Start** Compared With a Conventional Start: A Randomized Controlled Trial. Obstet Gynecol. 2007 Jun;109(6):1270-1276. Protocols that require a woman to wait until the next menses to start hormonal contraceptives are an obstacle to contraceptive initiation. Directly observed, immediate initiation of the pill improves short-term continuation. (InfoPOEMs: The immediate start of oral contraceptives (OCs) in young women improves initiation, but not continuation of use, and does not decrease pregnancy rates. (LOE = 1b))

Cheng L, Che Y, Gulmezoglu AM. Interventions for **emergency contraception**. Cochrane Database Syst Rev. 2012 Aug 15;8:CD001324. Intermediate-dose mifepristone (25-50 mg) was superior to LNG and Yuzpe regimens. Mifepristone low dose (< 25 mg) may be more effective than LNG (0.75 mg two doses), but this was not conclusive. UPA may be more effective than LNG. LNG proved to be more effective than the Yuzpe regimen. The copper IUD was the most effective EC method and was the only EC method to provide ongoing contraception if left in situ.

Clark MK, et al. Bone mineral density loss and recovery during 48 months in first-time users of depot medroxyprogesterone acetate. Fertil Steril. 2006 Nov;86(5):1466-74. Epub 2006 Sep 25. Depot MPA-related BMD loss is substantial but occurs mostly during the first 2 years of DMPA use. Therefore, longer use may not substantially increase the risk of osteoporosis. The prolonged recovery time suggests the need to consider timing of use in relation to menopause or other factors that may impede bone remodeling.

FDA BCDSP VTE & PE Evra Risk Jan/08 http://www.fda.gov/bbs/topics/NEWS/2008/NEW01781.html

FDA Apr/12 has completed its review of recent observational (epidemiologic) studies regarding the risk of blood clots in women taking drospirenone-containing birth control pills.Based on this review, FDA has concluded that **drospirenone**-containing birth control pills may be associated with a higher risk for blood clots than other progestin-containing pills. . Report that some epidemiologic studies reported as high as a three-fold increase in the risk of blood clots for drospirenone-containing products when compared to products containing levonorgestrel or some other progestins, whereas other epidemiological studies found no additional risk of blood clots with drospirenone-containing products.

Hidalgo MM, Hidalgo-Regina C, Bahamondes MV, et al. Serum levonorgestrel levels & endometrial thickness during extended use of the **levonorgestrel-releasing intrauterine** system. Contraception. 2009 Jul;80(1):84-9. Epub 2009 Feb 27. During extended use of the LNG-IUS, serum LNG levels were nearly half those found in the first 2 months of use (Wilcoxon signed rank test); serum E(2) levels were normal. Despite the very thin endometrium, menstrual bleeding was reinstated in many cases. At the end of its 5-year life span, there is a window for changing the LNG-IUS, and physicians and users should not be concerned about delaying replacement of the device for a short time beyond the approved life span; however, maintaining the same device long after its approved life span cannot be recommended.

Lopez LM, et al. Skin patch and vaginal ring versus combined oral contraceptives for contraception. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD003552. Effectiveness rates were similar for the methods compared. The patch group had better compliance than the COC group. Compared to COC users, patch users had more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge. The patch could lead to more discontinuation while the vaginal ring showed little difference. High losses to follow up can affect the validity of the results.

Lopez LM, Grimes DA, Gallo MF, Schulz KF. Skin patch and **vaginal ring versus combined oral contraceptives** for contraception. Cochrane Database Syst Rev. 2010 Mar 17;3:CD003552. Effectiveness was similar for the methods compared. The patch could lead to more discontinuation while the vaginal ring showed little difference. The patch group had better compliance than the COC group but more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge.

Lopez LM, Newmann SJ, Grimes DA, Nanda K, Schulz KF. Immediate start of hormonal contraceptives for contraception. *Cochrane Database Syst Rev.* 2008;(2):CD006260.

Lopez LM, Grimes DA, Chen-Mok M, et al. Hormonal contraceptives for **contraception in overweight or obese women**. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008452. Body weight addresses overall body size, while BMI generally reflects the amount of fat. Only one of three studies using BMI found a higher pregnancy risk for overweight women. The efficacy of implants and injectable contraceptives may be unaffected by body mass. The field could use trials of contraceptive methods with groups stratified by BMI. The current evidence on effectiveness by BMI is limited. However, the contraceptive methods examined here are still among the most effective when the recommended regimen is followed.

Lopez LM, Edelman A, Chen-Mok M, et al. **Progestin-only contraceptives: effects on weight**. Cochrane Database Syst Rev. 2011 Apr 13;4:CD008815. We found little evidence of weight gain when using POCs. Mean gain was less than 2 kg for most studies up to 12 months, and usually similar for the comparison group using another contraceptive. Appropriate counseling about typical weight gain may help reduce discontinuation of contraceptives due to perceptions of weight gain.

Lopez LM, Newmann SJ, Grimes DA, et al. **Immediate start of hormonal contraceptives** for contraception. Cochrane Database Syst Rev. 2012 Dec 12;12:CD006260. doi: 10.1002/14651858.CD006260.pub3. We found limited evidence that immediate start of hormonal contraception reduces unintended pregnancies or increases method continuation. However, the pregnancy rate was lower with immediate start of DMPA versus another method.

Lopez LM, Hiller JE, Grimes DA, et al. **Education** for contraceptive use by women after childbirth. Cochrane Database Syst Rev. 2012 Aug 15;8:CD001863. The overall quality of evidence was moderate. Half of these postpartum interventions led to fewer repeat pregnancies or births or more contraceptive use.

Lopez LM, Stockton LL, ChenM, SteinerMJ, GalloMF. **Behavioral interventions for improving dual-method contraceptive** use. Cochrane Database of Systematic Reviews 2014, Issue 3. Art. No.: CD010915. DOI: 10.1002/14651858.CD010915.pub2. We found few behavioral interventions for improving dual-method contraceptive use and little evidence of effectiveness. Amultifaceted program showed some effect but only had self-reported outcomes. Two trials were more applicable to clinical settings and had objective outcomesmeasures, but neither showed any effect.The included studies had adequate information on intervention fidelity and sufficient follow-up periods for change to occur.

Noé G, Croxatto HB, Salvatierra AM, et al. Contraceptive efficacy of emergency contraception with **levonorgestrel** given before or after ovulation. Contraception. 2011

Nov;84(5):486-92. The efficacy of LNG-EC has been overestimated in studies using presumptive menstrual cycle data. Our results confirm previous similar studies and demonstrate that LNG-EC does not prevent embryo implantation and therefore cannot be labeled as abortifacient.
…when used after ovulation has occurred, the number of observed and expected pregnancies is not statistically different, indicating that no reproductive process subsequent to ovulation is interfered with by LNG-EC….In conclusion, LNG-EC is highly effective for preventing unintended pregnancy when it is used before ovulation, but when used after ovulation, it is completely unable to prevent pregnancy because it has no effect on subsequent reproductive processes, including implantation of the embryo.

Van Vliet HA, Grimes DA, Lopez LM, et al. **Triphasic versus monophasic** oral contraceptives for contraception. Cochrane Database Syst Rev. 2011 Nov 9;11:CD003553.
The available evidence is insufficient to determine whether triphasic OCs differ from monophasic OCs in effectiveness, bleeding patterns or discontinuation rates. Therefore, we recommend monophasic pills as a first choice for women starting OC use. Large, high-quality RCTs that compare triphasic and monophasic OCs with identical progestogens are needed to determine whether triphasic pills differ from monophasic OCs.

Pearls for post-menopausal hormone therapy (HT):

- ♀ without hx of hysterectomy who are on estrogen should use a progestogen to protect against endometrial hyperplasia & carcinoma
- If last menstrual period < 1yr prior, a sequential combined regimen recommended (e.g. continuous estrogen with 12-14 days progestogen/month)
- If last menstrual period > 1yr prior, ♀ who wish to avoid monthly withdrawal bleed, may start continuous combined regimen
- If breakthrough bleeding occurs following switch to continuous combined & does not settle within 3-6months, consider switch back to sequential for 1 or more years
- If bleeding is heavy or erratic on sequential regimen, consider ↑ dose of progestagen (e.g. double)
- Persistent bleeding beyond 6 months warrant referral/investigation
- 90% of ♀ persisting with regimens will eventually be bleed free
- If AEs 2° to progestagen (mood swings, PMS like effects, androgenic effects), may ↓ dose by ½ &/or ↓ duration to 7 -10 days
- HT prescribed before age 60 has a favorable benefit/risk profile
- If using HT after age 60 lower doses (lowest effective dose) especially prudent due to gradually increasing risk
- Venlafaxine (75mg/day) was equal to low dose estrogen (estradiol 0.5mg/day) for treatment of vasomotor symptoms in a RCT.[Joffe H et al., 2014.]

[33] Rapp SR, Espeland MA, et al.; **WHIMS**. Effect of estrogen plus progestin on global cognitive function in postmenopausal women: the Women's Health Initiative Memory Study: a randomized controlled trial. JAMA. 2003 May 28;289(20):2663-72.
Resnick SM, Espeland MA, Jaramillo SA, Hirsch C, Stefanick ML, Murray AM, Ockene J, Davatzikos C. Postmenopausal hormone therapy and regional brain volumes: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):135-42. Conjugated equine estrogens

with or without MPA are associated with greater brain atrophy among women aged 65 years and older; however, the adverse effects are most evident in women experiencing cognitive deficits before initiating hormone therapy.
Coker LH, Hogan PE, Bryan NR, et al. Postmenopausal hormone therapy and subclinical cerebrovascular disease: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):125-34. Conjugated equine estrogen-based hormone therapy was not associated with a significant increase in ischemic brain lesion volume relative to placebo. This finding was consistent within each trial and in pooled analyses across trials.

[34] Shumaker SA, Legault C, et al.; **WHIMS**. Estrogen plus progestin & the incidence of dementia & mild cognitive impairment in postmenopausal women: Women's Health Initiative Memory Study: a randomized controlled trial. JAMA. 2003 May 28;289(20):2651-62. Estrogen plus progestin therapy increased the risk for probable dementia in postmenopausal women aged 65 years or older. In addition, estrogen plus progestin therapy did not prevent mild cognitive impairment in these women. (Shumaker SA, et al.; Women's Health Initiative Memory Study. Conjugated equine estrogens and incidence of probable dementia and mild cognitive impairment in postmenopausal women: Women's Health Initiative Memory Study. JAMA. 2004 Jun 23;291(24):2947-58. Estrogen therapy alone did not reduce dementia or MCI incidence and increased the risk for both end points combined.) (Maki PM, Gast MJ, Vieweg AJ, Burriss SW, Yaffe K. Hormone therapy in menopausal women with cognitive complaints: a randomized, double-blind trial. Neurology. 2007 Sep 25;69(13):1322-30. n=180. Cognitive Complaints in Early Menopause Trial (COGENT-stopped beause of WHI). There were no differences between groups on any cognitive or QoL measures, except for an increase in sexual interest and thoughts with HT. With the power to detect an effect size of >or=0.45, this study suggests potential modest negative effects on verbal memory that are consistent with previous hormone therapy trials in older women.) Petitti DB, Crooks VC, Chiu V, Buckwalter JG, Chui HC. Incidence of dementia in long-term hormone users. Am J Epidemiol. 2008 Mar 15;167(6):692-700. Epub 2008 Jan 23. After adjustment for age, education, and medical history, hazard ratios for incident dementia were 1.34 (95% confidence interval: 0.95, 1.89) in estrogen/progestin users and 1.23 (95% confidence interval: 0.94, 1.59) in estrogen users. These findings do not provide support for an effect of estrogen or estrogen/progestin use in preventing dementia.

(Rossouw JE, Prentice RL, Manson JE, et al. Postmenopausal hormone therapy and risk of cardiovascular disease by age and years since menopause. JAMA 2007; 297:1465-1477. Women who initiated hormone therapy closer to menopause tended to have reduced CHD risk compared with the increase in CHD risk among women more distant from menopause, but this trend test did not meet our criterion for statistical significance. A similar nonsignificant trend was observed for total mortality but the risk of stroke was elevated regardless of years since menopause.)
Ravdin PM, Cronin KA, Howlader N, et al. The **decrease in breast-cancer incidence** in 2003 in the United States. N Engl J Med 2007:356; 1670-1674. The decrease in breast-cancer incidence seems to be temporally related to the first report of the Women's Health Initiative and the ensuing drop in the use of hormone-replacement therapy among postmenopausal women in the United States.
Beral V, Million Women Study Collaborators. Ovarian cancer and hormone replacement therapy in the Million Women Study. Lancet 2007; DOI:10.1016/S0140-6736(07)60534-0.
Beral V; Million Women Study Collaborators; Bull D, Green J, Reeves G. Ovarian cancer and hormone replacement therapy in the **Million Women Study**. Lancet. 2007 May 19;369(9574):1703-10. Women who use HRT are at an increased risk of both incident and fatal ovarian cancer. Since 1991, use of HRT has resulted in some 1300 additional ovarian cancers and 1000 additional deaths from the malignancy in the UK.
Manson JE, Allison MA, Rossouw JE, Carr JJ, Langer RD, Hsia J, Kuller LH, Cochrane BB, Hunt JR, Ludlam SE, Pettinger MB, Gass M, Margolis KL, Nathan L, Ockene JK, Prentice RL, Robbins J, Stefanick ML; WHI and WHI-CACS Investigators. Estrogen therapy and **coronary-artery calcification**. N Engl J Med. 2007 Jun 21;356(25):2591-602. n=1064 Among women 50 to 59 years old at enrollment, the calcified-plaque burden in the coronary arteries after trial completion was lower in women assigned to estrogen only than in those assigned to placebo.
Vickers MR, MacLennan AH, Lawton B, et al. Main morbidities recorded in the Women's International Study of Long Duration Oestrogen After Menopause (**WISDOM**): a randomized controlled trial of hormone replacement therapy in postmenopausal women. BMJ 2007; DOI:10.1136/bmj.39266.425069 Hormone replacement therapy increases cardiovascular and thromboembolic risk when started many years after the menopause. The results are consistent with the findings of the women's health initiative study and secondary prevention studies. Research is needed to assess the long term risks and benefits of starting hormone replacement therapy near the menopause, when the effect may be different.
Kerlikowske K, Miglioretti DL, Buist DS, Walker R, Carney PA. **Declines in Invasive Breast Cancer** and Use of Postmenopausal Hormone Therapy in a Screening Mammography Population. J Natl Cancer Inst. 2007 Aug 14; [Epub ahead of print] Our finding of a statistically significant decline in the rate of ER-positive invasive breast cancer in a screening mammography population after the start of a concomitant substantial decline in postmenopausal hormone therapy use suggests that a decline in screening mammography rates is unlikely to account for the recent decline in US breast cancer incidence.
Li CI, Malone KE, Porter PL, et al. Relationship between Menopausal Hormone Therapy and Risk of Ductal, Lobular, and Ductal-Lobular Breast Carcinomas. Cancer Epidemiol Biomarkers Prev. 2008 Jan;17(1):43-50. Current CHT users for **>/=3 years have a substantially increased risk of lobular carcinomas**. Although lobular carcinomas are less common than ductal carcinomas (approximately 16% versus 70% of all invasive breast cancers in the United States), this duration is shorter than the 5 years of use widely cited to be needed to confer an increased risk of breast cancer overall.
Chlebowski RT, Anderson G, Pettinger M, et al. for the Women's Health Initiative Investigators. Estrogen Plus Progestin and **Breast Cancer Detection by Means of Mammography and Breast Biopsy**. Arch Intern Med. 2008 Feb 25;168(4):370-377. Use of conjugated equine estrogens plus medroxyprogesterone acetate for approximately 5 years resulted in more than 1 in 10 and 1 in 25 women having otherwise avoidable mammogram abnormalities and breast biopsies, respectively, and compromised the diagnostic performance of both. This adverse effect on breast cancer detection should be incorporated into risk-benefit discussions with women considering even short-term combined hormone therapy.
Heiss G, Wallace R, Anderson GL, et al. WHI Investigators. Health risks and benefits **3 years after stopping** randomized treatment with estrogen and progestin. JAMA. 2008 Mar 5;299(9):1036-45. The increased cardiovascular risks in the women assigned to CEE plus MPA during the intervention period were not observed after the intervention. A greater risk of fatal & nonfatal malignancies occurred after intervention in the CEE plus MPA group & the global risk index was 12% higher in women randomly assigned to receive CEE plus MPA compared with placebo.
Rohan TE, Negassa A, Chlebowski RT, et al.Conjugated Equine Estrogen and Risk of **Benign Proliferative Breast Disease**: WHI - A Randomized Controlled Trial. J Natl Cancer Inst. 2008 Apr 8; [Epub ahead of print] Use of 0.625 mg/d of CEE was associated with a statistically significant increased risk of benign proliferative breast disease.
Bray PF, Larson JC, Lacroix AZ, et al. Women's Health Initiative Investigators. Usefulness of baseline lipids and C-reactive protein in women receiving menopausal hormone therapy as predictors of treatment-related coronary events. Am J Cardiol. 2008 Jun 1;101(11):1599-1605. Epub 2008 Apr 2. In conclusion, postmenopausal women with **undesirable lipid levels** had excess coronary heart disease risk when using CEE with or without MPA. However, women with favorable lipid levels, especially LDL/HDL

cholesterol ratio <2.5, did not have increased risk of coronary heart disease with CEE with or without MPA irrespective of hs-CRP.
Resnick SM, Espeland MA, Jaramillo SA, Hirsch C, Stefanick ML, Murray AM Ockene J, Davatzikos C. Postmenopausal hormone therapy and regional **brain volumes**: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):135-42. Conjugated equine estrogens with or without MPA are associated with greater brain atrophy among women aged 65 years and older; however, the adverse effects are most evident in women experiencing cognitive deficits before initiating hormone therapy.
Coker LH, Hogan PE, Bryan NR, et al. Postmenopausal hormone therapy and **subclinical cerebrovascular disease**: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):125-34. Conjugated equine estrogen-based hormone therapy was not associated with a significant increase in ischemic brain lesion volume relative to placebo. This finding was consistent within each trial and in pooled analyses across trials.
Chlebowski RT, Kuller LH, Prentice RL, Stefanick ML, et al. WHI Investigators. **Breast cancer** after use of estrogen plus progestin in postmenopausal women. N Engl J Med. 2009 Feb 5;360(6):573-87. The increased risk of breast cancer associated with the use of estrogen plus progestin declined markedly soon after discontinuation of combined hormone therapy and was unrelated to changes in frequency of mammography.
Shetty KD, Vogt WB, Bhattacharya J. Hormone replacement therapy and cardiovascular health in the United States. Med Care. 2009 May;47(5):600-6. Decreased HRT use was not associated with reduced acute stroke rate but was associated with a decreased **acute myocardial infarction** rate among women. Our results suggest that observational data can provide correct inferences on clinical outcomes in the overall population if a suitable natural experiment is identified.
Prentice RL, Manson JE, Langer RD, et al. Benefits and risks of postmenopausal hormone therapy when it is initiated **soon after menopause**. (WHI) Am J Epidemiol. 2009 Jul 1;170(1):12-23. Epub 2009 May 25. These analyses provide little support for the hypothesis of favorable effects among women who initiate postmenopausal estrogen use soon after menopause, either for coronary heart disease or for health benefits versus risk indices considered.

Cummings SR, Ettinger B, Delmas PD, et al. **LIFT** Trial Investigators. The effects of **tibolone** in older postmenopausal women. N Engl J Med. 2008 Aug 14;359(7):697-708. Tibolone reduced the risk of fracture and breast cancer and possibly colon cancer but increased the risk of stroke in older women with osteoporosis. For every 1000 women treated for 1 year with tibolone, there will be approximately 9 fewer vertebral fractures, 7 fewer nonvertebral fractures, 2 fewer breast cancers, 1 fewer colon cancer, 2 more strokes, and 1 additional endometrial cancer. Although the authors recommend that tibolone not be used in women older than 70 years or in those who have risk factors for stroke, it is hard to see a compelling advantage of this drug for any group of women since bisphosphonates provide a safer way to prevent fracture. (LOE = 1b)

Haimov-Kochman R, Hochner-Celnikier D. Hot flashes revisited: pharmacological and herbal options for hot flashes management. What does the evidence tell us? Acta Obstet Gynecol Scand. 2005 Oct;84(10):972-9. CONCLUSIONS: A critical review of the literature shows that progesterone may have an independent effect on relieving hot flashes. New nonhormonal agents such as selective serotonin-uptake-inhibitor anti-depressants and a new anti-convulsant gabapentin yielded promising results on small well-conducted studies. Isoflavone's effect on hot flashes is variable and inconsistent, and only modest and delayed improvement of symptoms could be expected by BC and vitamin E. There are insufficient data on the other herbal alternative therapies at this time. Well-designed large studies are needed to further explore new modalities of treatment.

Marjoribanks J, Farquhar C, Roberts H, et al. **Long term hormone therapy for perimenopausal and postmenopausal women.**Cochrane Database Syst Rev. 2012 Jul 11;7:CD004143. HT is not indicated for primary or secondary prevention of cardiovascular disease or dementia, nor for preventing deterioration of cognitive function in postmenopausal women. Although HT is considered effective for the prevention of postmenopausal osteoporosis, it is generally recommended as an option only for women at significant risk, for whom non-oestrogen therapies are unsuitable. There are insufficient data to assess the risk of long term HT use in perimenopausal women or postmenopausal women younger than 50 years of age.

Motivala A, Pitt B. **Drospirenone** for oral contraception and hormone replacement therapy : are its cardiovascular risks and benefits the same as other progestogens? Drugs. 2007;67(5):647-55. Our review of the literature suggests that because of its anti-mineralocorticoid effects, drospirenone in conjunction with estrogen may prevent the development of cardiovascular disease in both pre- and post-menopausal women.

National Institutes of Health. National Institutes of Health State-of-the-Science Conference statement: **management of menopause-related** symptoms. Ann Intern Med. 2005 Jun 21;142(12 Pt 1):1003-13. Epub 2005 May 27.

Nedrow A, Miller J, Walker M, Nygren P, Huffman LH, Nelson HD. **Complementary and alternative** therapies for the management of menopause-related symptoms: a systematic evidence review. Arch Intern Med. 2006 Jul 24;166(14):1453-65.

Nelson HD, et al. **Nonhormonal therapies for menopausal hot flashes: systematic review** and meta-analysis. JAMA. 2006 May 3;295(17):2057-71. The SSRIs or SNRIs, clonidine, and gabapentin trials provide evidence for efficacy; however, effects are less than for estrogen, few trials have been published and most have methodological deficiencies, generalizability is limited, and adverse effects and cost may restrict use for many women. These therapies may be most useful for highly symptomatic women who cannot take estrogen but are not optimal choices for most women. (InfoPOEMs: Evidence supports the nonhormonal treatment of menopausal hot flashes with paroxetine (Paxil), clonidine (Catapres), gabapentin (Neurontin), and soy isoflavone extract. The overall effect size of all nonhormonal treatments is less than that of estrogen. Treatment should be individualized according to symptom severity and risk profiles. (LOE = 1a-)) (Reddy SY, et al. Gabapentin, Estrogen, and Placebo for Treating Hot Flushes: A Randomized Controlled Trial. Obstet Gynecol. 2006 Jul;108(1):41-48. Despite the small scale of this study, (12 week n=60) gabapentin appears to be as effective as estrogen in the treatment of postmenopausal hot flushes. (InfoPOEMs: In this small study, high-dose gabapentin (Neurontin) was as effective as the usual dose of conjugated equine estrogens (Premarin) for the treatment of menopausal vasomotor symptoms. Larger studies are needed to confirm this result. (LOE = 1b))) (Loprinzi CL, et al. Phase III comparison of depomedroxyprogesterone acetate to venlafaxine for managing hot flashes: North Central Cancer Treatment Group Trial N99C7. J Clin Oncol. 2006 Mar 20;24(9):1409-14. Epub 2006 Feb 27.)(Butt DA, Lock M, Lewis JE, Ross S, Moineddin R. Gabapentin for the treatment of menopausal hot flashes: a randomized controlled trial. North American Menopause Society. The role of **local vaginal estrogen for treatment of vaginal atrophy** in postmenopausal women: **2007 position statement** of The North American Menopause Society. Menopause. 2007 May-Jun;14(3):370-1. The choice of therapy should be guided by clinical experience and patient preference. Progestogen is generally not indicated when low-dose estrogen is administered locally for vaginal atrophy. Data are insufficient to recommend annual endometrial surveillance in asymptomatic women using vaginal ET. Vaginal ET should be continued for women as long as distressful symptoms remain. For women treated for non-hormone-dependent cancer, management of vaginal atrophy is similar to that for women without a cancer history. For women with a history of hormone-dependent cancer, management recommendations are dependent upon each woman's preference in consultation with her oncologist.

North American Menopause Society. **NAMS**: Estrogen and progestogen use in postmenopausal women: 2010 position statement of The North American Menopause Society. Menopause. **2010** Feb 12. Simon J, Nachtigall L, Gut R, Lang E, Archer DF, Utian W. Effective treatment of vaginal atrophy with an ultra-low-dose estradiol vaginal tablet. Obstet Gynecol. 2008 Nov;112(5):1053-60. After 12 weeks of treatment, an ultra-low-dose **10-microgram E2 vaginal tablet (Vagifem),** compared with placebo, demonstrated significant improvement for the primary endpoints: vaginal cytology and pH and most bothersome urogenital symptoms score. In this study a 10-mcg estradiol vaginal tablet used twice weekly was better than placebo for the reduction of bothersome postmenopausal vaginal symptoms. The tablet currently on the market (Vagifem, by the same manufacturer) is 25 mcg. Perhaps once weekly use of the available tablet would be equivalent to twice weekly use of the lower dose, but that would require another study that the manufacturer is unlikely to fund. (LOE = 2b)

Star Trial (Study of Tamoxifen and Raloxifene) for Breast Cancer Prevention Medical Letter May 8, 2006 & Pharmacist's Letter May 2006. InfoPOEMs: Tamoxifen (Nolvadex, Tamofen) and raloxifene (Evista) are similarly effective for reducing the risk of invasive breast cancer in postmenopausal women. Although women taking tamoxifen are at an increased risk of thromboembolic events and cataracts, they report improved sexual function compared with women taking raloxifene. All-cause mortality and overall quality-of-life were similar in both treatment groups. (LOE = 1b-).

Stefanick ML, et al. WHI Investigators. Effects of conjugated equine estrogens on breast cancer and mammography screening in postmenopausal women with hysterectomy. JAMA. 2006 Apr 12;295(14):1647-57. (InfoPOEMs: Estrogen therapy alone does not increase the risk of breast cancer in postmenopausal women with prior hysterectomy. Women receiving estrogen are more likely to require further testing as a result of questionably abnormal mammogram results, potentially leading to heightened anxiety and a reduced quality of life. The decision to use estrogen in postmenopausal women after hysterectomy should be individualized on the basis of overall potential risks and benefits. Women most likely to benefit from estrogen therapy include those with disabling hot flashes and an increased risk of osteoporotic fractures. Treatment should be limited whenever possible to the first 5 years (or less) after menopause. (LOE = 1b))

Shah NR, Borenstein J, Dubois RW. Postmenopausal hormone therapy and **breast cancer**: a systematic review and meta-analysis. Menopause. 2005 Nov-Dec;12(6):668-78. (InfoPOEMs: This meta-analysis of 13 large observational studies found that combined estrogen and progestin hormone therapy (CHT) for postmenopausal women is more likely than estrogen-only hormone therapy (ET) to be associated with breast cancer. This result is concondant with clinical trial data from the Women's Health Initiative (WHI). There is still uncertainty about whether ET increases the risk of breast cancer, based on the heterogeneity found in this meta-analysis and the discordance of these results with those from the WHI. (LOE = 2a))

Avenell A, Gillespie WJ, Gillespie LD, et al. Vitamin D and vitamin D analogues for preventing fractures associated with involutional and post-menopausal osteoporosis. Cochrane Database Syst Rev. 2005 Jul 20;(3):CD000227& ACP Journal Club . AUTHORS' CONCLUSIONS: Frail older people confined to institutions may sustain fewer hip and other non-vertebral fractures if given vitamin D with calcium supplements. Effectiveness of vitamin D alone in fracture prevention is unclear. There is no evidence of advantage of analogues of vitamin D compared with vitamin D. Calcitriol may be associated with an increased incidence of adverse effects. Dose, frequency, and route of administration of vitamin D in older people require further investigation.

Berger C, Langsetmo L, Joseph L, Hanley DA, et al. Canadian Multicentre Osteoporosis Study Research Group. Change in bone mineral density as a function of age in women and men and association with the use of antiresorptive agents. CMAJ. 2008 Jun 17;178(13):1660-8. (CaMos) The period of accelerated loss of bone mineral density in the hip bones occurring among women and men older than 65 may be an important contributor to the increased incidence of hip fracture among patients in that age group. The extent of bone loss that we observed in both sexes indicates that, in the absence of additional risk factors or therapy, repeat testing of bone mineral density to diagnose osteoporosis could be delayed to every 5 years.
Berry SD, Samelson EJ, Hannan MT, et al. **Second hip fracture** in older men and women: the framingham study. Arch Intern Med. 2007 Oct 8;167(18):1971-6. Following a first hip fracture, 2.5% of subjects experienced a second hip fracture within 1 year, and 8.2% of subjects (9.7% of women) experienced a second hip fracture within 5 years. One-year mortality following an initial hip fracture was 15.9% compared with 1-year mortality following a second hip fracture of 24.1%.Among survivors of an initial hip fracture, the incidence of a second hip fracture is substantial. Older age and functional status may be important predictors of a second hip fracture.

Black DM, Delmas PD, Eastell R, et al. **HORIZON** Pivotal Fracture Trial. **Once-yearly zoledronic** acid for treatment of postmenopausal osteoporosis. N Engl J Med. 2007 May 3;356(18):1809-22. Treatment with zoledronic acid reduced the risk of morphometric vertebral fracture by 70% during a 3-year period, as compared with placebo (3.3% in the zoledronic-acid group vs. 10.9% in the placebo group; relative risk, 0.30; 95% confidence interval [CI], 0.24 to 0.38) and reduced the risk of hip fracture by 41% (1.4% in the zoledronic-acid group vs. 2.5% in the placebo group; hazard ratio, 0.59; 95% CI, 0.42 to 0.83). Nonvertebral fractures, clinical fractures, and clinical vertebral fractures were reduced by 25%, 33%, and 77%, respectively (P<0.001 for all comparisons). Zoledronic acid was also associated with a significant improvement in bone mineral density and bone metabolism markers. Adverse events, including change in renal function, were similar in the two study groups. However, serious atrial fibrillation occurred more frequently in the zoledronic acid group 1.3 vs 0.5% (in 50 vs. 20 patients, P<0.001). A once-yearly infusion of zoledronic acid during a 3-year period significantly reduced the risk of vertebral, hip, and other fractures.

Effects of **Teriparatide** in Postmenopausal Women with Osteoporosis on **Prior Alendronate or Raloxifene**: Differences between Stopping and Continuing the Antiresorptive Agent.J Clin Endocrinol Metab. 2009 Jul 7. [Epub ahead of print] In women with osteoporosis treated with antiresorptives, greater bone turnover increases were achieved by switching to teriparatide, while greater BMD increases were achieved by adding teriparatide.

Cranney A, Adachi JD. Benefit-risk assessment of raloxifene in postmenopausal osteoporosis. Drug Saf. 2005;28(8):721-30.

Cranney A, et al. Clinical Guidelines Committee of **Osteoporosis Canada**. **Parathyroid hormone** for the treatment of osteoporosis: a systematic review. CMAJ. 2006 Jul 4;175(1):52-9. (InfoPOEMs: There is consistent evidence that human parathyroid hormone (hPTH) reduces the risk of recurrent fracture in very high-risk women with osteoporosis and a history of fracture. An accompanying guideline reports that the number needed to treat (NNT) with hPTH 34 (teriparatide [Forteo]) for 21 months to prevent one vertebral fracture is 11 and the NNT for 21 months to prevent one nonvertebral fracture is 34. This compares with NNTs of 9 and 34, respectively, for 36 months of alendronate. Given the much lower cost and greater convenience of alendronate and other bisphosphonates, teriparatide should be reserved for a very select group of very osteoporotic patients. (LOE = 1a))

Cummings SR, Black DM, Thompson DE, Applegate WB, Barrett-Connor E, Musliner TA, et al. Effect of **alendronate** on risk of fracture in women with **low bone density** but without vertebral fractures: results from the Fracture Intervention Trial (**FIT**). JAMA 1998;280:2077-82. CONCLUSIONS: In women with low BMD but without vertebral fractures, 4 years of alendronate safely increased BMD and decreased the risk of first vertebral deformity. Alendronate significantly reduced the risk of clinical fractures among women with osteoporosis but not among women with higher BMD. Alendronate increased BMD at all sites studied (P<.001) and reduced clinical fractures from 312 in the placebo group to 272 in the intervention group, but not significantly so (14% reduction; relative hazard [RH], 0.86; 95% confidence interval [CI], 0.73-1.01).

Cummings SR. **A 55-year-old woman with osteopenia**. JAMA. 2006 Dec 6;296(21):2601-10. (Khosla S, Melton LJ 3rd. Clinical practice. **Osteopenia**. N Engl J Med. 2007 May 31;356(22):2293-300.)

Cummings SR, Schwartz AV, Black DM. **Alendronate and atrial fibrillation**. N Engl J Med. 2007 May 3;356(18):1895-6. Serious atrial fibrillation: 1.5% alendronate vs 1% placebo during an average of 4 years of the FIT trial.

Cummings SR et al. **Lasofoxifene** in postmenopausal women with osteoporosis. N Engl J Med 2010 Feb 25; 362:686.

Cummings SR. **Long-term risk of incident vertebral fractures**. JAMA. 2007 Dec 19;298(23):2761-7. Low BMD and prevalent vertebral fractures are independently related to new vertebral fractures over 15 years of follow-up. Women with a prevalent vertebral fracture have a substantially increased absolute risk of an incident fracture, especially if they have osteoporosis diagnosed by BMD.

Ensrud K, et al Effect of **raloxifene** on **cardiovascular adverse events** in postmenopausal women with osteoporosis. Am J Cardiol. 2006 Feb 15;97(4):520-7. Epub 2006 Jan 4. Conclusion, we found no evidence of a beneficial or harmful effect of raloxifene on the incidence of cardiovascular events overall, or coronary or cerebrovascular events, in postmenopausal osteoporotic women at relatively low risk of cardiovascular events.

Ensrud KE, Ewing SK, Taylor BC, et al.; for the Study of Osteoporotic Fractures Research Group. Comparison of 2 Frailty Indexes for Prediction of Falls, Disability, Fractures, and Death in Older Women. Arch Intern Med. 2008 Feb 25;168(4):382-389. The simple SOF index (components of weight loss, inability to rise from a chair 5 times without using arms, and reduced energy level) predicts risk of falls, disability, fracture, and death as well as the more complex CHS index and may provide a useful definition of frailty to identify older women at risk of adverse health outcomes in clinical practice.

Etminan M, et al. Use of Oral Bisphosphonates and the Risk of Aseptic **Osteonecrosis**: A Nested Case-Control Study. J Rheumatol. 2008 Jan 15; [Epub ahead of print] In this cohort of elderly cardiovascular patients, an association was observed between oral bisphosphonate use and aseptic osteonecrosis.

Ettinger B, et al. Reduction of vertebral fracture risk in postmenopausal women with **osteoporosis** treated with **raloxifene**: a 3-yr randomized clinical trial. Multiple Outcomes of Raloxifene Evaluation (**MORE**) Investigators [correction JAMA 1999;282:2124]. JAMA 1999;282:637-45. CONCLUSIONS: In postmenopausal women with osteoporosis, raloxifene increases bone mineral density in the spine and femoral neck and reduces risk of vertebral fracture.

Ettinger B, Pressman A, Schein J, Chan J, Silver P, Connolly N. **Alendronate** use among 812 women: prevalence of gastrointestinal complaints, noncompliance with patient instructions, and discontinuation. J Managed Care Pharm 1998;4:488-92.

Favus Murray J., **Bisphosphonates for Osteoporosis**. N Engl J Med 2010; 363:2027-2035.

FDA July/11 notified healthcare professionals and patients about its ongoing review of data from published studies to evaluate whether use of **oral bisphosphonate** drugs is associated with an increased risk of cancer of the esophagus. FDA has not concluded that taking an oral bisphosphonate drug increases the risk of **esophageal cancer**. There are insufficient data to recommend endoscopic screening of asymptomatic patients.

Finkelstein JS, Hayes A, Hunzelman JL, Wyland JJ, Lee H, Neer RM. The effects of **parathyroid hormone, alendronate, or both** in men with osteoporosis. N Engl J Med. 2003 Sep 25;349(13):1216-26. Epub 2003 Sep 20.

Fogelman I, Ribot C, Smith R, et al. **Risedronate** reverses bone loss in postmenopausal women with **low bone mass**: results from a multinational, double-blind, placebo-controlled trial. **BMD-MN** Study Group. J Clin Endocrinol Metab. 2000 May;85(5):1895-900.

Formoso G, Perrone E, Maltoni S, et al. Short and long term effects of **tibolone** in postmenopausal women. Cochrane Database Syst Rev. 2012 Feb 15;2:CD008536. Tibolone, used at the daily dose of 2.5 mg, may be less effective than combined HT in alleviating menopausal symptoms although it reduced the incidence of vaginal bleeding. There was evidence that treatment with combined HT was more effective in managing menopausal symptoms than was tibolone. Available data on the long term safety of tibolone is concerning given the increase in the risk of breast cancer in women who had already suffered from breast cancer in the past and in a separate trial the increase in the risk of stroke in women whose mean age was over 60 years.

N Engl J Med. 2009 Feb 12;360(7):679-91. The addition of zoledronic acid to adjuvant endocrine therapy improves disease-free survival in premenopausal patients with estrogen-responsive early breast cancer.

Grant AM, Avenell A, Campbell MK, et al.; Oral vitamin D3 and calcium for secondary prevention of low-trauma fractures in elderly people (Randomised Evaluation of **Calcium Or vitamin D**, **RECORD**): a randomised placebo-controlled trial. Lancet. 2005 May;365(9471):1621-8 & ACP Journal Club. (InfoPOEMs: The combination of calcium 1000 mg and vitamin D3 800 IU was ineffective in preventing fractures in 2 studies enrolling a total of more than 8500 participants, almost all of whom were female and at least 70 years old and either had a previous osteoporotic fracture or were at high risk. The dose of calcium is lower than the 1500 mg commonly recommended and used. These results conflict with a meta-analysis that found that the combination therapy reduced fracture rate, including hip fracture, in older patients who have not had a previous hip or nonvertebral fracture (JAMA 2005; 293:2257-64). (LOE = 1b))

Harris ST, Watts NB, Genant HK, et al. Effects of **risedronate** treatment on vertebral and nonvertebral fractures in women with postmenopausal **osteoporosis**: a randomized controlled trial. Vertebral Efficacy with Risedronate Therapy (**VERT**) Study Group. JAMA 1999;282:1344-52. Treatment with 5 mg/d of risedronate, compared with placebo, decreased the cumulative incidence of new vertebral fractures by 41 % (95% confidence interval [CI], 18%-58%) over 3 years (11.3 % vs 16.3%; P= .003). A fracture reduction of 65% (95% CI, 38%-81 %) was observed after the first year (2.4% vs 6.4%; P<.001). The cumulative incidence of nonvertebral fractures over 3 years was reduced by 39% (95% CI, 6%-61 %) (5.2 % vs 8.4%; P = .02). Bone mineral density increased significantly compared with placebo at the lumbar spine (5.4% vs 1.1 %), femoral neck (1.6% vs -1.2%), femoral trochanter (3.3% vs -0.7%), and midshaft of the radius (0.2% vs -1.4%). Bone formed during risedronate treatment was histologically normal. The overall safety profile of risedronate, including gastrointestinal safety, was similar to that of placebo. CONCLUSIONS: These data suggest that risedronate therapy is effective and well tolerated in the treatment of women with established postmenopausal osteoporosis who had at least 1 **vertebral fracture at baseline**.

Health Canada May 2006: The **RUTH** study demonstrated an **increase in mortality due to stroke** for Evista compared to placebo. The incidence of stroke mortality was 1.5 per 1,000 women per year for placebo versus 2.2 per 1,000 women per year for Evista (p=0.0499). The incidence of stroke, myocardial infarction, hospitalized acute coronary syndrome, cardiovascular mortality, or overall mortality (all causes combined) was comparable for Evista and placebo. http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2006/evista_hpc-cps_e.html Barrett-Connor E, et al.; Raloxifene Use for The Heart (**RUTH**) Trial Investigators. Effects of raloxifene on cardiovascular events and breast cancer in postmenopausal women. N=10,101 5.6yrs N Engl J Med. 2006 Jul 13;355(2):125-37. (InfoPOEMs: For every 1000 women who take raloxifene for 5 years, we can expect 4 to 5 additional strokes, 6 additional episodes of venous thromboembolism (VTE), 6 fewer invasive breast cancers, and 6 to 7 fewer clinical vertebral fractures. The cost for this mixed bag of benefits and harms would be approximately $1000 per woman per year, for a total cost of $5,000,000 at current drug prices. (LOE = 1b))

Health Canada May/12: Cases of severe, sometimes **fatal, symptomatic hypocalcemia associated with XGEVA (denosumab)** treatment have been reported in cancer patients with bone metastases

Holder KK, Kerley SS. Alendronate for fracture prevention in postmenopause. Am Fam Physician. 2008 Sep 1;78(5):579-81. For vertebral fractures, a 45 percent relative risk reduction was found (relative risk [RR] = 0.55; 95% confidence interval [CI], 0.45 to 0.67). This was significant for primary prevention, with a 45 percent relative risk reduction (RR = 0.55; 95% CI, 0.38 to 0.80) and 2 percent absolute risk reduction; and for secondary prevention, with 45 percent relative risk reduction (RR = 0.55; 95% CI, 0.43 to 0.69) and 6 percent absolute risk reduction. For nonvertebral fractures, a 16 percent relative risk reduction was found (RR = 0.84; 95% CI, 0.74 to 0.94). This was significant for secondary prevention, with a 23 percent relative risk reduction (RR = 0.77; 95% CI, 0.64 to 0.92) and a 2 percent absolute risk reduction, but not for primary prevention (RR = 0.89; 95% CI, 0.76 to 1.04). There was a 40 percent relative risk reduction in hip fractures (RR = 0.60; 95% CI, 0.40 to 0.92), but only secondary prevention was significant, with a 53 percent relative risk reduction (RR = 0.47; 95% CI, 0.26 to 0.85) and a 1 percent absolute risk reduction. At 10 mg of alendronate per day, clinically important and statistically significant reductions in vertebral, nonvertebral, hip, and wrist fractures were observed for secondary prevention. The authors found no statistically significant results for primary prevention, with the exception of vertebral fractures, for which the reduction was clinically important.

Use of a continuous rather than a sequential estradiol-progestin regimen decreases the risk of endometrial cancer, whereas the route of administration or type of progestin does not differ in terms of endometrial cancer risk.

Jackson RD, LaCroix AZ, Gass M, et al.; Women's Health Initiative Investigators. Calcium plus vitamin D supplementation and the risk of fractures. N Engl J Med. 2006 Feb 16;354(7):669-83. Among healthy postmenopausal women, calcium with vitamin D supplementation resulted in a small but significant improvement in hip bone density, did not significantly reduce hip fracture, and increased the risk of kidney stones. (InfoPOEMs: The ability of a small dose of calcium and vitamin D to prevent fractures in healthy community-dwelling women is modest at best. This study used a relatively low dose of vitamin D (less than the 700 IU to 800 IU found most beneficial in previous studies), and the patients were generally at low risk of fracture. Perhaps that explains the discordance of these findings with the bulk of the literature on this topic. (LOE = 1b))

Mauck KF, Cuddihy MT, Atkinson EJ, Melton LJ 3rd. Use of clinical prediction rules in detecting osteoporosis in a population-based sample of postmenopausal women. Arch Intern Med 2005;165:530-36. (InfoPOEMs: Clinical prediction rules for low bone mineral density have limited usefulness in postmenopausal women. They may be most useful in selecting women to screen who are between 60 and 65 years old. Universal screening is already advocated for women 65 and older. For women younger than 60 the usefulness is limited by a combination of poor specificity of the rules and poor correlation of bone density with fracture risk. However, a low prediction rule score might assure a few women that they don't need to be tested. (LOE = 1b))

McClung MR, Geusens P, Miller PD, et al. Effect of **risedronate** on the risk of hip fracture in elderly women. Hip Intervention Program Study Group (**HIP**). N Engl J Med 2001;344:333-40. CONCLUSIONS: Risedronate significantly reduces the risk of hip fracture among elderly women with confirmed **osteoporosis** but not among elderly women selected primarily on the basis of risk factors other than low bone mineral density. RESULTS: Overall, the incidence of hip fracture among all the women assigned to risedronate was 2.8%, as compared with 3.9 % among those assigned to placebo (relative risk, 0.7; 95 percent confidence interval, 0.6 to 0.9; P=0.02). In the group of women with osteoporosis (those 70 to 79 years old), the incidence of hip fracture among those assigned to risedronate was 1.9 percent, as compared with 3.2 percent among those assigned to placebo (relative risk, 0.6; 95 percent confidence interval, 0.4 to 0.9; P=0.009). In the group of women selected primarily on the basis of nonskeletal risk factors (those at least 80 years of age), the incidence of hip fracture was 4.2 percent among those assigned to risedronate and 5.1 percent among those assigned to placebo (P=0.35).

Neer RM, Arnaud CD, Zanchetta JR, et al. Effect of **parathyroid hormone** (1-34) on fractures and bone mineral density in postmenopausal women with osteoporosis. N Engl J Med 2001;344:1434-41.RESULTS: New vertebral fractures occurred in 14 percent of the women in the placebo group and in 5 percent and 4 percent, respectively, of the women in the 20-microg and 40-microg parathyroid hormone groups; the respective relative risks of fracture in the 20-microg and 40-microg groups, as compared with the placebo group, were 0.35 and 0.31 (95 percent confidence intervals, 0.22 to 0.55 and 0.19 to 0.50). New nonvertebral fragility fractures occurred in 6 percent of the women in the placebo group and in 3 percent of those in each parathyroid hormone group (relative risk, 0.47 and 0.46, respectively [95 percent confidence intervals, 0.25 to 0.88 and 0.25 to 0.861). As compared with placebo, the 20-microg and 40-microg doses of parathyroid hormone increased bone mineral density by 9 and 13 more percentage points in the lumbar spine and by 3 and 6 more percentage points in the femoral neck; the 40-microg dose decreased bone mineral density at the shaft of the radius by 2 more percentage points. Both doses increased total-body bone mineral by 2 to 4 more percentage points than did placebo. Parathyroid hormone had only minor side effects (occasional nausea and headache). CONCLUSIONS: Treatment of postmenopausal osteoporosis with parathyroid hormone (1-34) decreases the risk of vertebral and nonvertebral fractures; increases vertebral, femoral, and total-body bone mineral density; and is well tolerated. The 40-microg dose increased bone mineral density more than the 20-microg dose but had similar effects on the risk of fracture and was more likely to have side effects.

Nevitt MC, Chen P, Dore RK, Reginster JY, Kiel DP, Zanchetta JR, Glass EV, Krege JH. Reduced risk of back pain following **teriparatide** treatment: a meta-analysis. Osteoporos Int. 2005 Sep 2; [Epub ahead of print]

Obermayer-Pietsch BM, Marin F, McCloskey EV, et al.; for the EUROFORS Investigators. Effects of **Two Years of Daily Teriparatide** Treatment on Bone Mineral Density in Postmenopausal Women with Severe Osteoporosis with and without Prior Antiresorptive Treatment. J Bone Miner Res. 2008 May 27. [Epub ahead of print] Nausea (13.3%) and arthralgia (11.7%) were the most commonly reported adverse events. Asymptomatic hypercalcemia was reported in 5.0% of patients. Teriparatide treatment for 24 months is associated with a significant increase in BMD in patients with and without previous AR use. Prior AR treatment modestly blunted the BMD response to teriparatide. Safety was consistent with current prescribing label information.

Suckling JA, Kennedy R, Lethaby A, Roberts H. **Local oestrogen for vaginal atrophy** in postmenopausal women. Cochrane Database of Systematic Reviews 2006, Issue 4. Art. No.: CD001500. DOI: 10.1002/14651858.CD001500.pub2. Creams, pessaries, tablets and the oestradiol vaginal ring appeared to be equally effective for the symptoms of vaginal atrophy. One trial found significant side effects following cream (conjugated equine oestrogen) administration when compared to tablets causing uterine bleeding, breast pain and perineal pain. Another trial found significant endometrial overstimulation following use of the cream (conjugated equine oestrogen) when compared to the ring. As a treatment choice women appeared to favour the oestradiol-releasing vaginal ring for ease of use, comfort of product and overall satisfaction.

World Health Organization randomized trial of calcium supplementation among low calcium intake pregnant women. Am J Obstet Gynecol. 2006 Mar;194(3):639-49. CONCLUSION: A 1.5-g calcium/day supplement did not prevent preeclampsia but did reduce its severity, maternal morbidity, and neonatal mortality, albeit these were secondary outcomes.

Vis M, Bultink IE, Dijkmans BA, Lems WF. The effect of **intravenous pamidronate** versus oral alendronate on bone mineral density in patients with osteoporosis. Osteoporos Int. 2005 May 10; [Epub ahead of print]

Vogel VG, et al. Effects of Tamoxifen vs Raloxifene on the Risk of Developing Invasive Breast Cancer and Other Disease Outcomes: The NSABP Study of Tamoxifen and Raloxifene (**STAR**) P-2 Trial. JAMA. 2006 Jun 5; [Epub ahead of print] Raloxifene is as effective as tamoxifen in reducing the risk of invasive breast cancer and has a lower risk of thromboembolic events and cataracts but a nonstatistically significant higher risk of noninvasive breast cancer. The risk of other cancers, fractures, ischemic heart disease, and stroke is similar for both drugs. (Land SR, et al. Patient-Reported Symptoms and Quality of Life During Treatment With Tamoxifen or Raloxifene for Breast Cancer Prevention: The NSABP Study of Tamoxifen and Raloxifene (STAR) P-2 Trial. JAMA. 2006 Jun 5; [Epub ahead of print] No significant differences existed between the tamoxifen and raloxifene groups in patient-reported outcomes for physical health, mental health, and depression, although the tamoxifen group reported better sexual function. Although mean symptom severity was low among these postmenopausal women, those in the tamoxifen group reported more gynecological problems, vasomotor symptoms, leg cramps, and bladder control problems, whereas women in the raloxifene group reported more musculoskeletal problems, dyspareunia, and weight gain.)

Walter C, Al-Nawas B, du Bois A, Buch L, Harter P, Grötz KA. Incidence of bisphosphonate-associated **osteonecrosis of the jaws in breast cancer** patients. Cancer. 2009 Jan 20. [Epub ahead of print] With a prevalence of 5.3%, BP-ONJ in breast cancer patients has become a relevant disease that should be discussed with patients for whom bisphosphonates have been recommended. Appropriate dental care before bisphosphonate therapy commences has been advised to reduce the occurrence of BP-ONJ.

Walter C, Al-Nawas B, Grötz KA, Thomas C, Thüroff JW, Zinser V, Gamm H, Beck J, Wagner W. Prevalence and Risk Factors of Bisphosphonate-Associated **Osteonecrosis of the Jaw in Prostate Cancer** Patients with Advanced Disease Treated with Zoledronate. Eur Urol. 2008 Jun 26. [Epub ahead of print] Eight of 43 patients developed BP-ONJ (18.6%). The reason for this relatively high incidence compared to other studies might be the prospective study design and thorough dental examination. In studies with such small numbers as have been published to date, nondetection or nonreported cases of BP-ONJ have an influence on the outcome. The incidence of BP-ONJ in patients with pCA might be an underestimated problem.

Warensjö Eva, Byberg Liisa, Melhus Håkan, et al. **Dietary calcium intake** and risk of fracture and osteoporosis: prospective longitudinal cohort study. BMJ 2011;342:doi:10.1136/bmj.d1473 (Published 24 May 2011)

Weinstein RS, Roberson PK, Manolagas SC. **Giant osteoclast** formation and long-term oral bisphosphonate therapy. N Engl J Med. 2009 Jan 1;360(1):53-62. Long-term alendronate treatment is associated with an increase in the number of osteoclasts, which include distinctive giant, hypernucleated, detached osteoclasts that are undergoing protracted apoptosis.

Wells G, Cranney A, Peterson J, Boucher M, et al. **Alendronate** for the primary & secondary prevention of osteoporotic fractures in postmenopausal women. **Cochrane** Database Syst Rev. **2008** Jan 23;(1):CD001155. At 10 mg per day, both clinically important and statistically significant reductions in vertebral, non-vertebral, hip and wrist fractures were observed for secondary prevention ('gold' level evidence, www.cochranemsk.org). We found no statistically significant results for primary prevention, with the exception of vertebral fractures, for which the reduction was clinically important ('gold' level evidence).

Wells G, Cranney A, Peterson J, Boucher M, Shea B, Robinson V, Coyle D, Tugwell P. **Etidronate** for the primary and secondary prevention of osteoporotic fractures in postmenopausal women. **Cochrane** Database Syst Rev. **2008** Jan 23;(1):CD003376. Etidronate, at 400 mg per day, demonstrated a statistically significant and clinically important benefit in the secondary prevention of vertebral fractures. No statistically significant reductions in vertebral fractures were observed when it was used for primary prevention. In addition, no statistically significant reductions in non-vertebral, hip, or wrist fractures were found, regardless of whether etidronate was used for primary or secondary prevention. The level of evidence for all outcomes is Silver (www.cochranemsk.org.).

Wells G, Cranney A, Peterson J, Boucher M, Shea B, Robinson V, Coyle D, Tugwell P. **Risedronate** for the primary and secondary prevention of osteoporotic fractures in postmenopausal women. **Cochrane** Database Syst Rev. **2008** Jan 23;(1):CD004523. At 5 mg/day a statistically significant and clinically important benefit in the secondary prevention of vertebral, non-vertebral and hip fractures was observed, but not for wrist. The level of evidence for secondary prevention is Gold (www.cochranemsk.org) for vertebral and non-vertebral and Silver for hip and wrist. There were no statistically significant reductions in the primary prevention of vertebral and non-vertebral fractures. The level of evidence is Silver.

TSH Trimester Specific Targets for Hypothyroidism

The 2011 American Thyroid Association (ATA) Guideline recommends a first trimester TSH target of <2.5mIU/L, and second & third trimester TSH targets of <3mIU/L.[12] These goals are often attainable with an increase in the levothyroxine dose, especially when the targets are met in early pregnancy. However, in clinical practice, there may be the rare occasion when it is difficult to reach the second & third trimester TSH target of <3mIU/L. This may occur when the levothyroxine dose required to achieve a TSH <3mIU/L results in symptoms of hyperthyroidism (e.g. maternal palpitations, failure to gain weight in either mother and/or fetus, or the development of maternal mood disorders). It may also result when pregnant patients are non-compliant with their levothyroxine as they are hesitant to take medications or increase their doses during pregnancy. In these rare situations, if a second and third trimester TSH <3mIU/L cannot be tolerated or attained, a TSH of <3.5mIU/L may be reasonable.

In 2012, the ATA & American Association of Clinical Endocrinologists released guidelines suggestion the following TSH targets: first trimester ≤ 2.5mIU/L, second trimester ≤ 3mIU/L & third trimester ≤ 3.5mIU/L.[12]

Art. No.: CD002020. DOI: 10.1002/14651858.CD002020.pub4. The findings of this review support the use of parenting programmes to improve the short-term psychosocial wellbeing of parents. Further input may be required to ensure that these results are maintained. More research is needed that explicitly addresses the benefits for fathers, and that examines the comparative effectiveness of different types of programme along with the mechanisms by which such programmes bring about improvements in parental psychosocial functioning.

Until better evidence is available the choice of antihypertensive should depend on the clinician`s experience and familiarity with a particular drug; on what is known about adverse effects; and on women`s preferences. Exceptions are nimodipine, magnesium sulphate (although this is indicated for women who require an anticonvulsant for prevention or treatment of eclampsia), diazoxide and ketanserin, which are probably best avoided.

Ohlsson A, Shah VS. Intrapartum antibiotics for known maternal **Group B streptococcal** colonization. Cochrane Database Syst Rev. 2012 Nov 10;1:CD007467. DOI: 10.1002/14651858.CD007467.pub3. Intrapartum antibiotic prophylaxis appeared to reduce EOGBSD, but this result may well be a result of bias as we found a high risk of bias for one or more key domains in the study methodology and execution. There is lack of evidence from well designed and conducted trials to recommend IAP to reduce neonatal EOGBSD. Ideally the effectiveness of IAP to reduce neonatal GBS infections should be studied in adequately sized double-blind controlled trials. The opportunity to conduct such trials has likely been lost, as practice guidelines (albeit without good evidence) have been introduced in many jurisdictions.

Pena-Rosas JP, De-Regil LM, Dowswell T, et al. **Intermittent oral iron supplementation** during pregnancy**.** Cochrane Database Syst Rev. 2012 Jul 11;7:CD009997. The present systematic review is the most comprehensive summary of the evidence assessing the benefits and harms of intermittent iron supplementation regimens in pregnant women on haematological and pregnancy outcomes. The findings suggest that intermittent iron+folic acid regimens produce similar maternal and infant outcomes at birth as daily supplementation but are associated with fewer side effects. Women receiving daily supplements had increased risk of developing high levels of Hb in mid and late pregnancy but were less likely to present mild anaemia near term.
Peña-Rosas JP, De-Regil LM, Dowswell T, Viteri FE. **Daily oral iron supplementation** during pregnancy. Cochrane Database of Systematic Reviews 2012, Issue 12. Art. No.: CD004736. DOI: 10.1002/14651858.CD004736.pub4. Prenatal supplementation with daily iron are effective to reduce the risk of low birthweight, and to prevent maternal anaemia and iron deficiency in pregnancy. Associated maternal side effects and particularly high Hb concentrations during pregnancy at currently used doses suggest the need to update recommendations on doses and regimens for routine iron supplementation.

Showell MG, Brown J, Clarke J, Hart RJ. **Antioxidants for female subfertility**. Cochrane Database Syst Rev. 2013 Aug 5;8:CD007807. The quality of the evidence in the 'antioxidant versus placebo/no treatment' and in the 'antioxidant versus antioxidant' comparisons was assessed to be 'very low'. Antioxidants were not associated with an increased live birth rate or clinical pregnancy rate. There was some evidence of an association of pentoxifylline with an increased clinical pregnancy rate; however, there were only three trials included in this comparison. Future trials may change this result. Variation in the types of antioxidants given meant that we could not assess whether one antioxidant was better than another. There did not appear to be any association of antioxidants with adverse effects for women, but data for these outcomes were limited.

20. Clegg et al . National Institutes of Health (NIH) Glucosamine/Chondroitin Arthritis Intervention Trial (**GAIT**) Clegg DO, et al. Glucosamine, chondroitin sulfate, and the two in combination for painful knee osteoarthritis. N Engl J Med. 2006 Feb 23;354(8):795-808. CONCLUSIONS: Glucosamine and chondroitin sulfate alone or in combination did not reduce pain effectively in the overall group of patients with osteoarthritis of the knee. Exploratory analyses suggest that the combination of glucosamine and chondroitin sulfate may be effective in the subgroup of patients with moderate-to-severe knee pain. (The 1,538-pts GAIT trial compared the effectiveness & safety of these supplements taken alone and in combination in patients with painful knee osteoarthritis (WOMAC Pain 125-400 mm) treated at 16 academic medical centers in the U.S. The response rate for all patients was 60.1% in a placebo group, 64% in a glucosamine hydrocholoride arm (500 mg TID); 65.4% in a chondroitin alone arm (400 mg TID); & 66.6% in a glucosamine-plus-chondroitin arm (500 mg/400mg TID) (p=0.09), according to a study results reported at the American College of Rheumatology meeting in San Diego Nov/05).
http://nccam.nih.gov/news/19972000/121100/qa.htm (InfoPOEMs: Glucosamine HCl and chondroitin provides modest if any symptomatic benefit for patients with mild osteoarthritis of the knee. This study was well designed and avoided many of the design flaws of earlier studies. However, it had a high dropout rate (20%) and used a different glucosamine salt than most previous studies. In addition, post-hoc analysis suggests a large benefit in patients with moderate to severe pain. There were also consistent trends toward benefit for many secondary outcomes. (LOE = 1b))

Birks J, Grimley EV, Van Dongen M. **Ginkgo bilo**ba for cognitive impairment and dementia. Cochrane Database Syst Rev. 2002;(4):CD003120. CONCLUSIONS: Ginkgo biloba appears to be safe in use with no excess side effects compared with placebo. Many of the early trials used unsatisfactory methods, were small, and we cannot exclude publication bias. Overall there is promising evidence of improvement in cognition and function associated with Ginkgo. However, the three more modern trials show inconsistent results. Our view is that there is need for a large trial using modern methodology and permitting an intention-to-treat analysis to provide robust estimates of the size and mechanism of any treatment effects.

Birdee GS, Phillips RS, Davis RB, Gardiner P. Factors associated with **pediatric use of complementary and alternative medicine**. Pediatrics. 2010 Feb;125(2):249-56. Epub 2010 Jan 25.

Birks J, Grimley Evans J. **Ginkgo biloba** for cognitive impairment and dementia. Cochrane Database Syst Rev. **2009** Jan 21;(1):CD003120. Ginkgo biloba appears to be safe in use with no excess side effects compared with placebo. Many of the early trials used unsatisfactory methods, were small, and publication bias cannot be excluded. The evidence that Ginkgo biloba has predictable and clinically significant benefit for people with dementia or cognitive impairment is inconsistent and unreliable.

CameronM, Chrubasik S. **Topical herbal therapies for treating osteoarthritis**. Cochrane Database of Systematic Reviews 2013, Issue 5. Art. No.: CD010538. DOI: 10.1002/14651858.CD010538. Although the mechanism of action of the topical medicinal plant products provides a rationale basis for their use in the treatment of osteoarthritis, the quality and quantity of current research studies of effectiveness are insufficient. Arnica gel probably improves symptoms as effectively as a gel containing non-steroidal anti-inflammatory drug, but with no better (and possibly worse) adverse event profile. Comfrey extract gel probably improves pain, and Capsicum extract gel probably will not improve pain or function at the doses examined in this review.

Cameron M, Chrubasik S. **Oral herbal therapies for treating osteoarthritis**. Cochrane Database Syst Rev. 2014 May 22;5:CD002947. Evidence for the proprietary ASU product Piasclidine® in the treatment of osteoarthritis symptoms seems moderate to high for short term use, but studies over a longer term and against an apparently active control are less convincing. Several other medicinal plant products, including extracts of Boswellia serrata, show trends of benefits that warrant further investigation in light of the fact that the risk of adverse events appear low.There is no evidence that Piasclidine® significantly improves joint structure, and limited evidence that it prevents joint space narrowing. Structural changes were not tested for with any other herbal intervention.Further investigations are required to determine optimum daily doses producing clinical benefits without adverse events.

Explore 2005;1:437-45. (InfoPOEMs: The pelargonium sidoides extract (Umckaloabo in Germany) produced a significantly greater reduction in symptoms of acute bronchitis than placebo, & more patients were satisfied with treatment. As with all herbal products, results may be different with pelargonium products other than this extract. (LOE = 1b))

Clegg et al . National Institutes of Health (NIH) Glucosamine/Chondroitin Arthritis Intervention Trial (**GAIT**) Clegg DO, et al. Glucosamine, chondroitin sulfate, and the two in combination for painful knee osteoarthritis. N Engl J Med. 2006 Feb 23;354(8):795-808. CONCLUSIONS: Glucosamine and chondroitin sulfate alone or in combination did not reduce pain effectively in the overall group of patients with osteoarthritis of the knee. Exploratory analyses suggest that the combination of glucosamine and chondroitin sulfate may be effective in the subgroup of patients with moderate-to-severe knee pain. (The 1,538-pts GAIT trial compared the effectiveness & safety of these supplements taken alone and in combination in patients with painful knee osteoarthritis (WOMAC Pain 125-400 mm) treated at 16 academic medical centers in the U.S. The response rate for all patients was 60.1% in a placebo group, 64% in a glucosamine hydrocholoride arm (500 mg TID); 65.4% in a chondroitin alone arm (400 mg TID); & 66.6% in a glucosamine-plus-chondroitin arm (500 mg/400mg TID) (p=0.09), according to a study results reported at the American College of Rheumatology meeting in San Diego Nov/05). http://nccam.nih.gov/news/19972000/121100/ga.htm (InfoPOEMs: Glucosamine HCl and chondroitin provides modest if any symptomatic benefit for patients with mild osteoarthritis of the knee. This study was well designed and avoided many of the design flaws of earlier studies. However, it had a high dropout rate (20%) and used a different glucosamine salt than most previous studies. In addition, post-hoc analysis suggests a large benefit in patients with moderate to severe pain. There were also consistent trends toward benefit for many secondary outcomes. (LOE = 1b)) Sawitzke AD, Shi H, Finco MF, Dunlop DD, Bingham CO 3rd, Harris CL, Singer NG, Bradley JD, Silver D, Jackson CG, Lane NE, Oddis CV, Wolfe F, Lisse J, Furst DE,Reda DJ, Moskowitz RW, Williams HJ, Clegg DO. The effect of glucosamine and/or chondroitin sulfate on the progression of knee osteoarthritis: A report from the glucosamine/chondroitin arthritis intervention trial. (GAIT) Arthritis Rheum. 2008 Sep 29;58(10):3183-3191. [Epub ahead of print] At 2 years, no treatment achieved a predefined threshold of clinically important difference in JSW loss as compared with placebo. However, knees with K/L grade 2 radiographic OA appeared to have the greatest potential for modification by these treatments.

Complementary and alternative medicine-what people ≥50 are using & discussing with their doctor Jan/07 Nearly two-thirds of older people in the U.S. use complimentary or alternative therapies, but less than a third of the users discuss the practice with their physicians, according to a survey commissioned by the NIH and the AARP. The survey was based on interviews last year with about 1600 people aged 50 and older. The leading reason people said they don't discuss alternative therapies -- which include herbal and dietary supplements, massage, and chiropractic manipulation -- is that physicians never ask. Others said, among other reasons, that they did not know they should or they did not have enough time during the office visit. In addition, nearly 75% of respondents report taking one or more prescription medications, and nearly 60% said they take over-the-counter medications. http://assets.aarp.org/rgcenter/health/cam_2007.pdf

Connor KM, Payne V, Davidson JR. **Kava** in generalized anxiety disorder: three placebo-controlled trials. Int Clin Psychopharmacol. 2006 Sep;21(5):249-53. No evidence of hepatotoxicity was found with kava, and all of the treatments were well tolerated. Findings from these three controlled trials do not support the use of kava in DSM-IV generalized anxiety disorder.

Dhiman RK, Chawla YK. Herbal medicines for liver diseases. Dig Dis Sci. 2005 Oct;50(10):1807-12. (InfoPOEMs: There is insufficient evidence to recommend most commonly used herbal medicines for the treatment of liver disease. Of the 4 products evaluated in this review -- Phyllanthus, Silybum marianum (milk thistle), **glycyrrhizin** (licorice root extract), and Liv 52 (a mixture of herbs) -- available evidence supports only the use of the **licorice root extract** in the treatment of subacute liver failure and the prevention of hepatocellular carcinoma in patients with chronic hepatitis C. (LOE = 2a))

DMAA: July 25/12- Manufacturers of some sports supplements are falsely claiming a compound known as DMAA is a natural substance derived from geraniums, researchers say. Instead, research shows that DMAA is synthetic, consisting of four compounds called stereoisomers. DMAA (1,3-dimethylamylamine) is a stimulant found in some nutritional and sport supplements.

Dodge HH, Zitzelberger T, Oken BS, et al. A randomized placebo-controlled trial of ginkgo biloba for the prevention of cognitive decline. Neurology. 2008 Feb 27; [Epub ahead of print] n=118 42 month In unadjusted analyses, **ginkgo biloba** extract (GBE) neither altered the risk of progression from normal to Clinical Dementia Rating (CDR) = 0.5, nor protected against a decline in memory function. Secondary analysis taking into account medication adherence showed a protective effect of GBE on the progression to CDR = 0.5 and memory decline.

Elderberry extract has long been used as a folk remedy for cold and influenza symptoms. A recent randomized trial provides evidence for its efficacy (level 2 [mid-level] evidence). During the spring 2009 influenza season in China, 64 patients with ≥ 3 influenza-like symptoms (fever, headache, myalgias, coughing, nasal mucus discharge, nasal congestion) were randomized within 24 hours of symptom onset to elderberry extract lozenge (175 mg) vs. placebo orally 4 times daily for 2 days. After 48 hours, the rate of complete symptom relief was higher in the elderberry group (28% vs. 0%, no p value reported), with at least some symptom relief (only 0-2 mild symptoms remaining) reported in 88% vs. 16% for placebo (no p value reported). Elderberry extract was associated with significantly improved symptom severity scores for headache, nasal congestion, muscle aches, and fever at 24 hours ($p < 0.001$) and for all symptoms at 48 hours ($p < 0.001$). The elderberry group had higher symptom scores at baseline, however, suggesting that the groups may have been at different stages in their overall illness course despite randomization within 24 hours (Online J Pharmacol Pharmacokin 2009;5:32).

FDA May 2007 FDA chemical analysis revealed that **Energy Max** contains thione analog of sildenafil, a substance with a structure similar to sildenafil, the active ingredient in Viagra, an FDA-approved drug for ED.Substances like this are called analogs because they have a structure similar to another drug and may cause similar side effects and drug interactions. **True Man** contains a thione analog of sildenafil or piperadino vardenafil, an analog of vardenafil, the active ingredient in Levitra, another FDA-approved prescription drug for ED. Neither the thione analog of sildenafil nor piperadino vardenafil are components of approved drug products.

FDA Feb/08 Palo Alto Labs and FDA notified consumers and healthcare professionals of a voluntary nationwide recall of two dietary supplements, **Aspire36** and **Aspire Lite**. The products were recalled because they were found to contain Aildenafil in trace amounts and Dimethyl sildenafil thione, an analog of Sildenafil, a drug used to treat erectile dysfunction.

FDA Mar/08 The U.S. Food and Drug Administration is advising consumers not to purchase or use "**Blue Steel**" or "**Hero**" products, marketed nationally as dietary supplements, because these products contain undeclared ingredients similar to sildenafil.

FDA April/08 **Herbal Science International**, Inc. and FDA informed consumers and healthcare professionals of a nationwide recall of twelve dietary supplements that contain ephedra, aristolochic acid or human placenta because they may present a serious health hazard to consumers. FDA has long regarded dietary supplements containing ephedra, a botanical that contains ephedrine alkaloids, as a potential health hazards because the alkaloid raises blood pressure and otherwise stress the circulatory system.

FDA May/08 is requesting that the manufacturer of **Xiadafil** — an "all natural" dietary supplement sold to treat erectile dysfunction — recall all its stock from natural food stores & discontinue marketing it on the Web since it contains an analog of sildenafil.

FDA May/08 notified consumers and healthcare professionals that supplement products sold under the brand name of **Viril-ity Power** (VIP) Tablets is being recalled because one lot was found to contain a potentially harmful undeclared ingredient, hydroxyhomosildenafil, an analog of sildenafil.

FDA May/08 The US Food and Drug Administration advised consumers not to use the products **Total Body Formula** in Tropical Orange and Peach Nectar flavours, and **Total Body Mega Formula** in Orange/Tangerine flavour, because they contain high doses of selenium and chromium.

FDA July/08 Jack Distribution, LLC issued a voluntary nationwide recall of selected lots of **Rize 2 The Occasion Capsules** and **Rose 4 Her Capsules**, marketed as dietary supplements. The products were recalled because certain lots contained thiomethisosildenafil, an undeclared analog of sildenafil, a FDA-approved drug used for Erectile Dysfunction.

FDA July/08 not to buy or use **Viapro** 375mg Capsules because one lot of the product was found to contain a potentially harmful undeclared ingredient, thio-methisosildenafil, an analog of sildenafil.

FDA Nov/08 Balanced Health Products, Inc. announced a recall of **STARCAPS** due to the presence of an undeclared drug ingredient, Bumetanide. Bumetanide is a diuretic indicated for the treatment of edema associated with congestive heart failure, hepatic and renal disease including nephrotic syndrome.

FDA Nov/08 Fashion Sanctuary announced a recall of **Zhen De Shou Fat Loss** Capsules because FDA analysis found the product to contain undeclared sibutramine, an FDA approved drug used as an appetite suppressant for weight loss.

FDA Dec/08 alerted consumers not to purchase or consume more than **25 different products** marketed for weight loss because they contain undeclared, active pharmaceutical ingredients that may put consumers' health at risk. The undeclared active pharmaceutical ingredients in some of these products include sibutramine (a controlled substance), rimonabant (a drug not approved for marketing in the USA), phenytoin (an anti-seizure medication), and phenolphthalein (a solution used in chemical experiments and a suspected cancer causing agent). The weight loss products, some of which are marked as "dietary supplements," are promoted and sold on various web sites and in some retail stores. FDA advises consumers who use the products to stop taking them and consult their healthcare professional immediately as the health risks posed by these products can be serious (for example, high blood pressure, seizures, tachycardia, palpitations, heart attack or stroke). FDA also encourages consumers to seek guidance from healthcare professional before purchasing weight loss products. See the FDA News Release for a listing of the names of the 25 referenced products. Read the MedWatch 2008 safety summary, including links to the News Release and Questions and Answers, at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Weight

FDA Jan/09 notified consumers not to take **Venom HYPERDRIVE 3.0**, a product sold as a dietary supplement but containing sibutramine.

FDA Apr/09: **ABC Beauty Supply** & FDA notified consumers and healthcare professionals of a recall of 34 dietary supplement products. FDA lab analyses identified undeclared **sibutramine**, an FDA- approved drug, used as an appetite suppressant for weight loss. http://www.fda.gov/oc/po/firmrecalls/universalabc04_09.html

FDA Apr/09 Nature & Health Co. and FDA notified healthcare professionals of a recall of a supplement product, **Libimax**. FDA analysis found the product contains tadalafil

FDA May/09 warned consumers to immediately stop using **Hydroxycut** products by Iovate Health Sciences, Inc. Hydroxycut products are associated with a number of serious **liver injuries**. Hydroxycut products are dietary supplements that are marketed for weight-loss, as fat burners, as energy-enhancers, as low carb diet aids, and for water loss under the **Iovate and MuscleTech brand** names. FDA has received 23 reports of serious health problems ranging from jaundice and elevated liver enzymes, an indicator of potential liver injury, to liver damage requiring liver transplant. One death due to liver failure has been reported to FDA. Other health problems reported include seizures; cardiovascular disorders; and rhabdomyolysis, a type of muscle damage that can lead to other serious health problems such as kidney failure.

FDA June/09 notified consumers and healthcare professionals to discontinue use of three **Zicam Nasal Gel/Nasal Swab** products sold over-the-counter as cold remedies because they are associated with the loss of sense of smell that may be long-lasting or permanent.

FDA July/09 and Haloteco notified healthcare professionals and consumers of a nationwide voluntary recall of Libipower Plus. Lab analysis of **Libipower Plus** samples were found to contain undeclared Tadalalafil.

FDA July/09 notified healthcare professionals that four weight loss dietary supplements sold and marketed by the firm (**Slimbionic, One Weight Loss Pill, SlimDemand Capsules, Botanical Weight Loss**) contain sibutramine.

FDA Aug/09 not to use body-building products marketed as containing steroids or steroid-like substances. The affected products are TREN-Xtreme, MASS Xtreme, ESTRO Xtreme, AH-89-Xtreme, HMG Xtreme, MMA-3 Xtreme, VNS-9 Xtreme, and TT-40-Xtreme..

FDA Nov/09 notified consumers that **Stiff Nights**, a product sold as a dietary supplement, contains sulfoaildenafil, a chemical similar to sildenafil (Viagra).

FDA Nov/09 & GMP Herbal Products notified consumers and healthcare professionals of a recall of **Pai You Guo**, a weight loss dietary supplement, due to the presence sibutramine & phenolphthalein.

FDA Nov/09 & RockHard Laboratories notified consumers that **RockHard Weekend**, a product sold as a dietary supplement, contains sulfoaildenafil, an analogue of sildenafil.

FDA Nov/09 & IDS Sports notified consumers that five of the IDS's dietary supplement products (**Bromodrol, Dual Action Grow Tabs, Grow Tabs, Mass Tabs, and Ripped Tabs TR**) contain the following undeclared substances, which FDA considers to be steroids: "Madol," "Turinabol," "Superdrol," &/or "Androstenedione."

FDA Dec/09 for **S-DROL**: a voluntary recall by the manufacturer of one lot (lot# 810481, expiry date 01/2012) of S-DROL after FDA testing found it to contain undeclared desoxymethyltestosterone.

FDA Dec/09 warned consumers to stop using bodybuilding products manufactured by American Cellular Labs after they were found to contain unauthorized synthetic steroids in **TREN-Xtreme, MASS Xtreme, ESTRO Xtreme, AH-89-Xtreme, HMG Xtreme, MMA-3 Xtreme, VNS-9 Xtreme, TT-40-Xtreme.**

FDA Dec/09 warned that **Atlas Operations, Inc**. notified consumers of a nationwide recall of the company's dietary supplements for sexual enhancement. These products are sold as dietary supplements throughout the USA. FDA lab analyses found that the products tested from certain batches contain Sulfoaildenafil.

FDA Dec/09 The Texas Department of State Health Services and FDA notified healthcare professionals and consumers, especially pregnant or breastfeeding women, to avoid consuming a product called "**Nzu**", taken as a traditional remedy for morning sickness,because of the potential health risks from high levels of lead and arsenic, noted on laboratory analysis by Texas DSHS. Nzu, which is sold at African specialty stores is also called Calabash clay, Calabar stone, Mabele, Argile and La Craie. It generally resembles balls of clay or mud and is usually sold in small plastic bags with a handwritten label identifying it as "Nzu" or "Salted Nzu."

FDA Jan/10 & **MuscleMaster(dot)com**, Inc. notified consumers and healthcare professionals of the voluntary nationwide recall of all lots and expiration dates of the seventeen dietary supplements listed in the firm press release, sold between June 1, 2009 and November 17, 2009. FDA informed MuscleMaster(dot)com that it believes that the recalled products contain ingredients that are **steroids**.

FDA Jan/10 notified consumers and healthcare professionals about a counterfeit and potentially harmful version of **Alli 60 mg capsules** (120 count refill kit). The **counterfeit** version contained the controlled substance sibutramine and did not contain orlistat, the active ingredient.

FDA Mar/10 & Natural Wellness notified consumers that **MasXtreme**, a product sold as a dietary supplement contains aildenafil close in structure to sildenafil and is expected to possess a similar pharmacological and adverse event profile as well as the drug phentolamine which is an alpha-adrenergic blocker.

FDA Apr/10 & Kanec USA notified healthcare professionals of a nationwide recall of **Stud Capsule For Men** [Lot #060607-01/060108-01, Exp 6-2013], after being informed by FDA that laboratory analysis of a sample found the product to be adulterated with sildenafil, an FDA approved drug.

FDA May/10 notified healthcare professionals, their patients, and consumers not to consume **Vita Breath**, a dietary supplement manufactured by American Herbal Lab and marketed at health fairs and on the Internet, because the product may contain hazardous levels of lead.

FDA June/10 **Magic Power Coffee**: Product marketed as a dietary supplement for sexual enhancement contains the drug ingredient hydroxythiohomosildenafil.

FDA July/10 analysis of **Que She** found that it contains: fenfluramine – a stimulant drug withdrawn from the U.S. market in 1997 after studies demonstrated that it caused serious heart valve damage, propranolol – a prescription beta blocker drug that can pose a risk to people with bronchial asthma and certain heart conditions, sibutramine – a controlled substance and prescription weight loss drug, sibutramine was the subject of a recent study whose preliminary findings showed an association between sibutramine use and increased risk of heart attack and stroke in patients who have a history of heart disease, & ephedrine – a stimulant drug that is legally marketed over-the-counter for temporary relief of asthma but can pose a risk to people with certain cardiovascular conditions.

FDA Aug/10 lab analysis of **Solo Slim** was found to contain the undeclared drug ingredient Didesmethyl Sibutramine.

FDA Aug/10 lab analysis of **Revivexxx Extra Strength** was found to contain undeclared tadalafil.

FDA Aug/10 notified Novacare LLC that certain products appear to contain sulfoaildenafil: **Stiff Nights, Aziffa, Size Matters, Erex, Mojo, Hard Drive, Eyeful, Red Magic, Straight Up, Zotrex, Monster Excyte, WOW, Xaitrex, Verect, Prolatis, Xytamax, Maxyte, Libidinal, OMG, OMG45, and Zilex (with Golden Spear) summers**.

FDA July/10 lab analysis of **Slim-30** Herb Supplement distributed by the company was found to contain undeclared N-Desmethyl Sibutramine and traces of Sibutramine.

FDA July/10 & Good Health, Inc. is conducting a voluntary recall after FDA lab analyses found that the product tested from certain batches of **Vialipro** contain Sulfoaildenafil.

FDA July/10 lab analysis of this herb supplement, **Joyful Slim** Herb Supplement, was found to contain the undeclared drug, desmethyl sibutramine.

FDA July/10 warned consumers not to consume or use **Miracle Mineral Solution**, an oral liquid solution also known as "Miracle Mineral Supplement" or "**MMS**." The product, when used as directed, produces an industrial bleach.

Harpagophytum procumbens, Salix alba, and Capsicum frutescens seem to reduce pain more than placebo. Additional trials testing these herbal medicines against standard treatments will clarify their equivalence in terms of efficacy. The quality of reporting in these trials was generally poor; thus, trialists should refer to the CONSORT statement in reporting clinical trials of herbal medicines. (InfoPOEMs: If these authors have included all the relevant studies, it appears that there is modest evidence that herbal remedies (oral Harpagophytum procumbens [devil's claw] and Salix alba [white willow bark], as well as topical Capsicum frutescens [cayenne]) alleviate acute episodes of chronic nonspecific low back pain in adults. In general, the reporting of the trials included in this systematic review was poor. Finally, this body of literature is prone to bias in favor of publishing positive results. (LOE = 1a-)) See also Cochrane Database Syst Rev. 2006 Apr 19;(2):CD004504.

Geng J, Dong J, Ni H, et al. Ginseng for cognition. Cochrane Database of Systematic Reviews 2010, Issue 12. Art. No.: CD007769. DOI: 10.1002/14651858.CD007769.pub2. Currently, there is a lack of convincing evidence to show a cognitive enhancing effect of Panax ginseng in healthy participants and no high quality evidence about its efficacy in patients with dementia. Randomized, double-blind, placebo-controlled, parallel group trials with large sample sizes are needed to further investigate the effect of ginseng on cognition in different populations, including dementia patients.

Genistein: Atteritano M, Marini H, Minutoli L, et al. Effects of the phytoestrogen genistein on some predictors of cardiovascular risk in osteopenic, postmenopausal women: a two-year randomized, double-blind, placebo-controlled study. J Clin Endocrinol Metab. 2007 Aug;92(8):3068-75. Epub 2007 May 22. These results suggest that 54mg genistein plus calcium, vitamin D(3), and a healthy diet was associated with favorable effects on both glycemic control and some cardiovascular risk markers in a cohort of osteopenic, postmenopausal women. D'Anna R, Cannata ML, Atteritano M, et al. Effects of the phytoestrogen genistein on hot flushes, endometrium, and vaginal epithelium in postmenopausal women: a 1-year randomized, double-blind, placebo-controlled study. Menopause. 2007 Jul-Aug;14(4):648-55. The phytoestrogen genistein has been shown to be effective on vasomotor symptoms without an adverse effect on endometrium. Marini H, Minutoli L, Polito F, et al. Effects of the phytoestrogen genistein on bone metabolism in osteopenic postmenopausal women: a randomized trial. Ann Intern Med. 2007 Jun 19;146(12):839-47. Summary for patients in: Ann Intern Med. 2007 Jun 19;146(12):I34. Twenty-four months of tx with genistein has positive effects on BMD in osteopenic postmenopausal women.

Health Canada Aug/13 **Prema G** (Granules packaged in tea packets, NPN: 80035944) was tested by Canada Border Services Agency and found to contain a hidden ingredient (hydroxyhomosildenafil thione).

Health Canada Oct/13 is warning consumers not to use unauthorized **Compound Danshen Dripping Pills** after it was associated with a Canadian case of methemoglobinemia, a rare but serious condition which may result in coma or death.

Health Canada Oct/13 Natural health product (**Spectrazyme**) recalled due to potential contamination with the antibiotic chloramphenicol. Metagenics Canada, in consultation with Health Canada, is voluntarily recalling its natural health product "Spectrazyme" – a digestive aid – due to a possible contamination with chloramphenicol, an antibiotic that may pose serious health risks to consumers.

Health Canada Oct/13 Natural health product (**Flora Essentials**) recalled due to potential contamination with the antibiotic chloramphenicol.

Health Canada Oct/13 Natural health products (**Kamizym-U and Kamizym+)** recalled due to potential contamination with the antibiotic chloramphenicol.

Health Canada Oct/13 wishes to inform Canadians that seized natural health products being sold by Lion King Health Enterprises Group Ltd., 1328-8368 Capstan Way, Richmond, BC. were tested and found to contain hidden ingredients and unauthorized substances similar to the prescription drug, sildenafil. (**North America Dami Ana 600mg, South America Maca 600mg, Ashwagandha 600mg, Optimusman 350mg, Superman 350mg, Innerget Instant Erection (NPN#80041194), Innerget Prolonged Performance (NPN#80041194), Innerget Everlasting Strength (NPN#80041194), Megaton 2080**.)

Health Canada Nov/13 is advising Canadians not to use these foreign health products as they may pose a health risk. These products have been found by regulators in other countries to contain drug ingredients or soy milk allergens that are not declared on the product labels, or a high level of microbial contamination. Prescription drugs should only be taken under the supervision of a healthcare professional. These products are not authorized for sale in Canada and have not been found on the Canadian market, but they may have been brought into the country by travellers or purchased over the Internet:

1. **Protein Extract and artiph**en http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36237a-eng.php ;
2. **Aisiyuan V26 Slimming Granules, AcaiBerry Living-XS, and 4C Cosmoslim** , http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36269a-eng.php ;
3. **MAXILOSS Weight Advanced** http://healthycanadians.gc.ca/recall-alert- rappel-avis/hc-sc/2013/36197a-eng.php;
4. **14 sexual enhancement products** http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36233a-eng.php ;
5. **Ginseng Baji Gu Ci Wan, Tu Chong Ginseng Wan Le Seang and X-Tract Nature** http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36359a-eng.php ;
6. **Ziyinzhuangyang tablets, Maxman III, and Mojo Risen** http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36519a-eng.php ;
7. **Kyuwei** http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36515a-eng.php ;
8. **ESV Extra Strong Version, MSV Strong Version, RL Rapid Loss, My Slimmer Me (MSM) soft gel capsules, Natural Miaotiaoyishen capsules, and Paiyouji Natural Slimming Capsules** http://healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2013/36521a-eng.php.

Health Canada Dec/13 has updated the list of natural health products seized from **Lion King Health Enterprises Group** Ltd., 1328 - 8638 Capstan Way, Richmond, B.C. that have been tested and found to contain hidden ingredients and unauthorized substances similar to the prescription drug tadalafil.

Health Canada Dec/13 General Nutrition Centres Company (GNC), in consultation with Health Canada, is voluntarily recalling its natural health product "**Women's Phytoestrogen Formula**" – used for the relief of menopausal symptoms – due to possible contamination with chloramphenicol.

Health Canada Dec/13 testing of an unauthorized natural health product, **MaxHIMize**, found it to contain bacteria (Enterococcus durans and Bacillus spp) and undeclared caffeine that could present a risk to health. MaxHIMize is being promoted as a dietary supplement and for erectile dysfunction.

Health Canada Feb/14: 1. **Hairegenerator** The Hong Kong Department of Health warned consumers not to use this product after samples of the product were found to exceed the permissible limit for mercury. The level of mercury exceeds Health Canada's acceptable limits as well. 2. **Li Long Mei Guo Mo Bang, and Ginseng Tu chong Wan Lin Heong** The Singapore Health Sciences Authority warned consumers not to use this product after it was found to contain sildenafil, a drug ingredient that was not declared on the product label. 3. **Lightning 10.0+, LV Shou Reduces Fat, and STB Summit of the Thin Body S Woman Degreasing Burning Pill** The Hong Kong Department of Health warned consumers not to use this product after it was found to contain sibutramine, phenolphthalein, and indomethacin.

Health Canada Mar/14 is advising Canadians not to use these foreign health products as they may pose a health risk. 1. Xiang Gang Tian Long Sheng Wu Ke Ji Di Qi Dai Chi Jiu Zhan Shen http://www.healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2014/38599a-eng.php was found to contain **sildenafil**. 2. Various Sexual Enhancement Products http://www.healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2014/38577a-eng.php was found to have **sildenafil** and **tadalafil.** 3. Majestic Slim Perfect and Yixiu L-Carnitine Slimming Capsules http://www.healthycanadians.gc.ca/recall-alert-rappel-avis/hc-sc/2014/38609a-eng.php was found to contain **sildenafil** and **phenolphthalein.**

Health Canada Mar/14: **Zyrexin**, tested by Health Canada at the border was found to contain a hidden prescription drug ingredient **(Yohimbine)** .

Health Canada Apr/14 has seized the unauthorized drug, "**L-Showm Weight Loss Pills**", being sold at the U-Box store, located at 2809-4500 Kingsway, Burnaby, BC. Health Canada testing found that it contained an undisclosed ingredient, phenolphthalein.

Health Canada Apr/14: Four unauthorized drugs being sold at two SVN FUEL stores - one in Burnaby and one in Coquitlam, B.C. - were seized by Health Canada as they contain ingredients that are potentially dangerous to the health of consumers. The products, and the unapproved ingredients they contain, include **Jack3d** (DMAA (1, 3-dimethylamylamine), **Red Rockets** (ephedrine and caffeine), **West Pharm Therma Lean** (ephedrine and caffeine), and **OxyElite Pro** (1, 3-dimethylamylamine HCl and Yohimbe Bark extract). They were being promoted for weight management.

Health Canada Apr/14: 1) **San Xiao Ping Tang Jin Qi Jiao Nang**: The Hong Kong Department of Health warned consumers not to use this product after it was found to contain phenformin, pioglitazoneand glibenclamide**. 2) Volcano Male Enhancement** liquid & caps: The U.S. Food and Drug Administration warned consumers not to use these products after they were found to contain desmethyl carbodenafil, dimethylsildenafil and dapoxetine**. 3) Dr. Larry's Tranquility**: The U.S. Food and Drug Administration warned consumers not to use this product after it was found to contain undeclared doxepin and chlorpromazine.

Health Canada Apr/14: Nano Well-being Health Inc. issued a voluntary recall of **Super Arthgold**, 500 mg capsules to the consumer level. FDA laboratory analysis has found the product to contain chlorzoxazone, diclofenac and indomethacin, making it an unapproved new drug.

Health Canada May/14 **Blue Stinger** contains sulfoaildenafil**; 72 HP, Evil root and Pro Power Max** contains sildenafil**; Esbelin siloutte te, Esbelin Siloutte Herbal blend with L-Carnitine, Esbelder man**, **Esbelder fem, Esbelder siloutte** contains Sibutramine, N-Desmethylsibutramine, and N-di-Desmethylsibutramine; **Instant Slim** contains sibutramine and phenolphthalein; **Jack Rabbit** contains sildenafil and tadalafil**; Live Clinical 90 caps** contains milk, **Ortiga** contains diclofenac.

Health Canada May/14 One lot of **Lite Fit USA (**Lot Number 13165, Exp. 05/17) is being voluntarily recalled in the U.S. after analysis by the U.S. Food and Drug Administration revealed the lot contains the undeclared prescription drug sibutramine.

Health Canada May/14 has requested that Christmas Natural Foods Ltd. stop selling and recall its unauthorized health product, **Heartland Natural Wild Yam Moisturizing Cream**, after testing conducted by the Department identified a undisclosed prescription drug ingredient, progesterone.

Health Canada May/14: 1. **VitaliKOR**: FDA found vardenafil and tadalafil**;** 2. **Slim Fortune, Lidiy & Slim Expert** FDA found sibutramine**;** 3. **Vigor Tea sachets:** Australian Therapeutic Goods Administration found sulfoaildenafil**;** 4. **Prolifta capsules, PHUK and Virilis Pro:** FDA found **sildenafil;** 5. **Dr. Mao Slimming capsules, Perfect Body Solutions, Burn 7**: FDA found sibutramine; **Bella Vi Insane Amp'd Up, Be Inspired, Goodliness Fat Reducing capsules, Jimpness Beauty Fat Loss capsule**s: FDA found sibutramine and phenolphthalein; 6. **Nature Most Laboratories Vanilla Almond, and Strawberry Banana Whey Power products**: FDA found undeclared milk, soy and almond allergens**;** 7. **Wood-E, Xzen Gold, Xzen XPress, XZen 1200, and XZone Premium**: FDA found Wood-E contains sildenafil, Xzen Gold and Xzen XPress contain sildenafil and tadalafil, & XZen 1200 contains tadalafil.

Health Canada June/14: **Bali Mojo & Vimax** contains tadalafil., **LOVher capsule**s contains tadalafil, sildenafil and diclofenac. **Erec-Bull,** contains yohimbine. **Best Whips & JINQIANGBUDOR Red Dragon** contains sildenafil. **Super Hard t**ablets contains sildenafil. **CONTROL All Natural Sexual Enhancement** contains sulfoaildenafil and dimethylsildenafil. **Phen Tabz contains dimethylamylamine (DMAA). Asset Extreme, Asset Extreme Plus, Meizitang Citrus, Slimming Diet Berry Plus, Citrus Fit Gold, Hot Detox, Thinogenics** contains sibutramine. **Tonic Life BP & Slimfast capsules** contains phenolphthalein . **Dr**. **Ming's Chinese Capsule**, **Magic Slim and Apple's Quic**k **Impact Weight Loss** contains sibutramine and phenolphthalein. **Pro ArthMax** contains diclofenac, ibuprofen, naproxen, indomethacin, chlorzoxazone. **Adipotrim XT** contains fluoxetine. **StemAlive** contains milk.

Long-term effects of **chondroitins 4 and 6 sulfate** on knee osteoarthritis: The study on osteoarthritis progression prevention, a two-year, randomized, double-blind, placebo-controlled trial. Arthritis Rheum. 2009 Jan 29;60(2):524-533. [Epub ahead of print] We performed an international, randomized, double-blind, placebo-controlled trial in which 622 patients with knee OA were randomly assigned to receive either 800 mg CS (n = 309 patients) or placebo (n = 313 patients) once daily for 2 years. The long-term combined structure-modifying and symptom-modifying effects of CS suggest that it could be a disease-modifying agent in patients with knee OA.

Karsch-Völk M, Barrett B, Kiefer D, et al. **Echinacea for preventing and treating the common cold**. Cochrane Database of Systematic Reviews 2014, Issue 2. Art. No.: CD000530. DOI:10.1002/14651858.CD000530.pub3. Echinacea products have not here been shown to provide benefits for treating colds, although, it is possible there is a weak benefit from some Echinacea products: the results of individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.

Kassab S, Cummings M, Berkovitz S, van Haselen R, Fisher P. Homeopathic medicines for adverse effects of cancer treatments. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD004845. This review found preliminary data in support of the efficacy of topical calendula for prophylaxis of acute dermatitis during radiotherapy & Traumeel S mouthwash in the treatment of chemotherapy-induced stomatitis. These trials need replicating. There is no convincing evidence for the efficacy of homeopathic medicines for other adverse effects of cancer treatments.

Our findings have to be interpreted with caution due to high or unclear risk of bias of the included trials. {22 RCTs, n=2130, range of 1-6 months with mean duration 2.3 +/- 1.3 months, high or unclear risk of ibias, no outcome data (too short & too small), no SAEs; Xuezhikang most commonly used; possible TC lowering (-0.90mmol/L vs inositol nicotinate)}.

Linde K, Mulrow CD, Berner M, **St John's** wort for depression. Cochrane Database Syst Rev. 2005 Apr 18;(2):CD000448. CONCLUSIONS: Current evidence (37 trials) regarding hypericum extracts is inconsistent and confusing. In patients who meet criteria for major depression, several recent placebo-controlled trials suggest that the tested hypericum extracts have minimal beneficial effects while other trials suggest that hypericum and standard antidepressants have similar beneficial effects. As the preparations available on the market might vary considerably in their pharmaceutical quality, the results of this review apply only to the products tested in the included studies.

Linde K, Berner MM, Kriston L. **St John`s wort** for major depression. Cochrane Database Syst Rev. 2008 Oct 8;(4):CD000448. The available evidence suggests that the hypericum extracts tested in the included trials a) are superior to placebo in patients with major depression; b) are similarly effective as standard antidepressants; c) and have fewer side effects than standard antidepressants. The association of country of origin and precision with effects sizes complicates the interpretation.

Liu Y, Liu JP, Xia Y. **Chinese herbal medicines for treating osteoporosis**. Cochrane Database Syst Rev. 2014 Mar 6;3:CD005467.
Current findings suggest that the beneficial effect of Chinese herbal medicines in improving BMD is still uncertain and more rigorous studies are warranted.

Marples, Brian November 1, 2007 -- Patients with prostate cancer should be warned against using over-the-counter prostate-related health supplements because these items could make normal prostate cells more sensitive than usual to the effects of radiation, researchers reported here at the 49th annual meeting of the American Society for Therapeutic Radiology and Oncology (ASTRO). Researchers at William Beaumont Hospitals, Royal Oak, Michigan, United States, led by Brian Marples, PhD, Biology Radiologist, Department of Radiation Oncology, William Beaumont Hospitals, Royal Oak, Michigan, United States, tested three prostate-specific dietary supplements: Trinovin (red clover, biochanin A, formononetin, daidzein, genistein [phytoestrogen]), Provelex (lycopene, soy, saw palmetto, quercetin [phytoestrogen], selenium) and **ProstateRx (saw palmetto).** Their findings indicated that ProstateRx and other similar health store items were problematic in patients undergoing radiotherapy.

Medicines and Healthcare products Regulatory Agency (MHRA) Dec/07 said: **Xiao Qin Long Wan**, a cold and flu medicine; pain reliever **Chuan Xiong Cha Tiao Wan**; **Bai Tou Weng Wan**, sold for stomach problems, and **Xie Gan Wan**, used to treat stress may contain Aristolochicia, which in unlicensed medicines was banned in UK in 1999

Melchart D, Linde K, Fischer P, **Echinacea** for preventing and treating the **common cold**. Cochrane Database Syst Rev. 2000;(2):CD000530. CONCLUSIONS: The majority of the available studies report positive results. However there is not enough evidence to recommend a specific Echinacea product, or Echinacea preparations for the treatment or prevention of common colds.

MHRA Aug 2011 issues warning over traditional Chinese medicines containing **Lei Gong Teng** (**tripterygium wilfordii**)

MHRA Dec/11Health Sciences Authority in Singapore has issued a press release warning the public of four adulterated health products. **ATHRI-Eze** - is marketed as a traditional Chinese medicine and packaged in a bottle of 20 white capsules. **SEAR HEANG TIENCHI TU CHUNG WAN** - claims to treat rheumatic pain and backache and is sold in a bottle of 40 black pills with a red label. **CAP WIJAYA KUSUMA (AN KI IT)** and **WIKU JAHE KENCUR (AKUR MUJARAB)** - are promoted as Malay Jamu (postnatal) medicines, which are packed in foil sachets of brown powder and are labelled to treat rheumatoid and arthritic conditions.These four products have been found to contain undeclared pharmaceutical medicines. Ingredients found include: dexamethasone, furosemide, paracetamol, chlorpheniramine (also known as chlorphenamine), phenylbutazone, allopurinol & prednisolone.

MHRA Dec/11 In response to an urgent notice issued by MHRA, Bee Health Ltd has agreed to stop marketing FSC Black Cohosh 1000 mg due to concerns about the high dosage of black cohosh in the product. The MHRA advises consumers not to take the FSC Black Cohosh product as it equates to 50 times the dose approved for traditional herbal medicinal products used to relieve menopausal symptoms. It is not known what the risks or effects on the body could be associated with such a high level of Black Cohosh.

MHRA Jan/12 Consumers are advised not to take unlicensed **Butterbur (Petasites hybridus)** herbal remedies. Butterbur contains pyrrolizidine alkaloids (PAs) which studies have shown can result in serious liver damage and organ failure. PAs have also been shown to lead to cancer in animals. Butterbur is most commonly used to treat migraine and hayfever. Butterbur products have been associated with cases of liver toxicity; 40 cases have been reported in the literature. Of these cases, nine were of acute hepatitis and two of the nine cases resulted in liver failure requiring transplantation. The cases of liver toxicity appear to have occurred with extracts of Butterbur where the PAs had been removed and only small amounts remained. There is some evidence that other constituents found in Butterbur such as the sesquiterpene constituents for example petasin may be implicated in the liver toxicity.

MHRA Feb/12 Herbal sliming products found to contain potentially dangerous undeclared pharmaceuticals: **Expelling Grease Slimming Abdomen, V12 Fruit Slimming, 100% Natural Weight Loss Coffee, Leisure 18 Slimming Orange Juice, Fashion Slimming Milk Shake, Langli, Ya Buk & Fruit and vegetables lose weight**. MHRA has received advice from the Danish Medicines Agency that these unlicensed products have been tested and found to contain the Prescription Only Medicine Sibutramine.

MHRA Feb/12 has received advice from AGES PharmMed in Austria and the Danish Medicines Agency, warning that these unlicensed products have been tested and found to contain Tadalafil and/or Sildenafil: **AH Free/Reflexit, Stree Overlord, Man King, VigRX, Maxman, Maxman III, Viriya, & Imbiza for Men.**

MHRA Feb/12 Following a safety alert issued in October 2010 about slimming products containing Paiyouji the Agency has received a further complaint about a product called '**Paiyouji Plus - Fast Acting Slimming Tea**'. This product has been tested by the Agency and, as in the case of other Paiyouji products, found to contain sibutramine.

MHRA Mar/12 Traditional Chinese Medicine (TCM) **Anshen Bunao Pian** (Chung Lien Kulin Brand) has been found by the Department of Health in Hong Kong to contain 55 times the level of mercury permitted in China. Acute mercury poisoning can damage the neurological system and kidneys. The product is manufactured in mainland China and imported by Fung Wah (HK) Company.

MHRA July/12 Department of Health in Hong Kong have issued a warning asking members of the public not to buy or consume an oral product called '**Ling Zhi She Xiang Tong Mai Dan'**, as it may contain an undeclared pharmaceutical, dexamethasone.

MHRA Aug/12 **Echinacea should not be given to children under 12 years**: Oral herbal products containing echinacea should not be given to children under 12 years, the Medicines and Healthcare products Regulatory Agency (MHRA) has warned. http://www.mhra.gov.uk/NewsCentre/Pressreleases/CON180627 [Accessed 24 October 2012].

MHRA: Austrian Sep/12 authorities have issued a warning for **Ramlostan Forte** manufactured by SC Parapharm, Romania. Ramlostan comes in white and blue packaging, with a picture of a ram at the top. Inside, there are ten blue capsules. The Austrian authority (AGES) has issued a warning for this product after finding it to contain Tadalafil.

MHRA Oct/12 The UK Medicines and Healthcare products Regulatory Agency (MHRA) has issued a reminder about a potential adverse effect of liver problems when using **Black Cohosh** to relieve symptoms of the menopause. The MHRA has issued a press release reminding people about the risk of liver problems with Black Cohosh, following a serious case of liver failure resulting in a liver transplant suspected to have been caused by a herbal product containing Black Cohosh. The investigation of this case and of the product involved is ongoing. To date, the MHRA has received 53 reports of adverse reactions suspected to be associated with the use of Black Cohosh.

MHRA, Viridian Nutrition has agreed to recall stocks of **Black Cohosh** Root Capsules, as some batches of the product have been found to contain an undeclared plant species in addition to the declared plant species. The product is labelled as containing Black Cohosh, which is the common name of Cimicifuga racemosa, as specified in the European, British and American Pharmacopoeia. However tests carried out on the product have shown that the product also contains other Cimicifuga species, probably Cimicifuga foetida.

MHRA Nov/12 has received advice from the Danish Medicines Agency that this unlicensed product, **Ultra Slim** has been tested and found to contain the Prescription Only Medicine Sibutramine.

MHRA Nov/12 has received advice from the Ministry of Health, Jerusalem warning that this unlicensed product, **Shark Essence** has been tested and found to contain Tadalafil and Sildenafil.

MHRA Dec/12 Medicines and Healthcare products Regulatory Agency, 2012. Liver failure case highlights need to use **Black Cohosh** remedies carefully [online].

Available: http://www.mhra.gov.uk/NewsCentre/Pressreleases/CON199545

MHRA Feb/13 is advising consumers not to use the products specified below due to sibutramine content. Product names**: Fashion Slimming Coffee, L-Carnitine + P57, L-CarnitinL 360 Slimming Coffee, Brazil Potent Slimming Coffee sachets, Coffee 26 Original sachets, Coffee Nature Fashion Slimming sachets, Slender Capsule, Slim-1.**

MHRA Feb/13 Hong Kong Department of Health issues warnings about **Traditional Chinese Medicines (TCM) found to contain heavy** metals. Product names: [W.S.] Tian Ma Toutong Wan; Shi Hu Ye Guang Wan (Ye Guang Wan); Nai Chang Ming Yan Pills (Ming Yan Pills); [Fung Shing Pai] Tian-Ma Wan; Bak Foong Pills (11 products - see below for details).

MHRA Aug/13 has recently been made aware of several unlicensed herbal products which have been found to contain **heavy metals**: **Bak Foong Pills, Hairegenerator, Niu-Huang Chieh-tu-pien, Divya Kaishore Guggul, Chandraprabha Vati.**

MHRA May/14: Advising consumers not to use Ayurvedic Herbal Medicine **Shwasa Sanjeevani** as it has been found to contain dexamethasone. Hong Kong Department of Health found that samples of **Hairegenerator** exceeded the permissible limit for mercury. Singapore Health Sciences Department **Li Long Mei Guo Mo Bang** because it contains sildenafil & **Ginseng Tu chong Wan Lin Heong** contains dexamethasone.

Michel BA, Stucki G, Frey D, et al. **Chondroitins** 4 and 6 sulfate in osteoarthritis of the knee: a randomized, controlled trial. Arthritis Rheum 2005; 52:779-86.
(InfoPOEMs: After 2 years of treatment, chondroitin sulfate had no effect on comfort in patients with severe degenerative arthritis of the knee. Compared with placebo, however, it appears that chondroitin may have a small protective effect on the joint. The clinical relevance of this effect not known. (LOE = 1b))

Mills E, Singh R, Ross C, Ernst E. Sale of **kava** extract in some health food stores. CMAJ. 2003 Nov 25;169(11):1158-9. (January 2002, Health Canada issued an advisory, followed by a ban in August 2002, on the sale of herbal kava. One month after the advisory, 22 (67%) of 33 health food stores approached were selling kava. Two months after the ban, 17 (57%) of 30 stores continued to sell kava. These findings demonstrate that health food stores may need to be better informed about the sale of restricted natural health products.

Oct/13 The workout supplement marketed as "**Craze**" contains a potentially dangerous designer drug — a methamphetamine analog — according to an article in Drug Testing and Analysis. The analog, N,alpha-diethyl-phenylethylamine (N,alpha-DEPEA), was found in three different samples of the product obtained from separate sources and analyzed by two labs. The product's label claims it contains phenylethylamines derived from dendrobium, but the authors say the component identified as N,alpha-DEPEA has never been identified in dendrobium. They say the amounts of N,alpha-DEPEA found "strongly suggest" that it's not a minor contaminant, adding that if their findings are confirmed, the FDA should "remove all N,alpha-DEPEA-containing supplements from the marketplace." The Boston Globe reports that another supplement, "**Detonate**," also contained N,alpha-DEPEA upon analysis.

Pittler MH, Ernst E. **Horse chestnut** seed extract for chronic venous insufficiency. Cochrane Database Syst Rev. 2006 Jan 25;(1):CD003230. The evidence presented implies that HCSE is an efficacious & safe short-term treatment for CVI. However, several caveats exist and more rigorous RCTs are required to confirm the efficacy of this treatment option.

Pittler MH, Ernst E. **Kava** extract for treating anxiety. Cochrane Database Syst Rev. 2003;(1):CD003383. CONCLUSIONS: Compared with placebo, kava extract appears to be an effective symptomatic treatment option for anxiety. The data available from the reviewed studies suggest that kava is relatively safe for short-term treatment (1 to 24 weeks), although more information is required. Further rigorous investigations, particularly into the long-term safety profile of kava are warranted.

Pittler MH, Ernst E. **Feverfew** for preventing migraine. Cochrane Database Syst Rev. 2004;(1):CD002286. CONCLUSIONS: There is insufficient evidence from randomised, double-blind trials to suggest an effect of feverfew over & above placebo for preventing migraine. It appears from the data reviewed that feverfew presents no major safety problems.

Pittler MH, Guo R, Ernst E. **Hawthorn extract** for treating chronic heart failure. Cochrane Database Syst Rev 2008; DOI: 10.1002/14651858.CD005312.pub2. (Not included in the review was the survival and Prognosis: Investigation of Crataegus Extract WS1442 in CHF (**SPICE**) trial, which was ongoing as Pittler et al were screening relevant trials. As reported by heartwire when the study was later presented at the American College of Cardiology 2007 Scientific Sessions, adding the herbal to ACE inhibitors, beta blockers, and other components of contemporary therapy failed to alter a composite primary end point that included sudden cardiac death, death due to progressive heart failure, fatal or nonfatal MI, and HF hospitalization at 24 months. The trial did support hawthorn extract's good safety record, however.)

Predy GN, Goel V, Lovlin R, et al. Efficacy of an extract of North American **ginseng (Cold-fx)** containing poly-furanosyl-pyranosyl-saccharides for preventing upper respiratory tract infections: a randomized controlled trial. CMAJ. 2005 Oct 25;173(9):1043-8. INTERPRETATION: Ingestion of a poly-furanosyl-pyranosyl-saccharide-rich extract of the roots of North American ginseng in a moderate dose **400mg (2 capsules) over 4 months** reduced the mean number of colds per person (0.99 vs 0.71), the proportion of subjects who experienced 2 or more colds (24.8 vs 10%), the severity of symptoms and the number of days cold symptoms were reported (from 11.1 days to only 8.7 days). The number of people with 1 cold was 64.4 vs 56.1% with Cold-fX in **healthy** 18-65yrs old (mean 43yrs), n=323 with a history of at least 2 colds in the previous year. Limitations: not virologically proven influenza or more typical common cold illnesses studied will be important in the future, only most severe illnesses were evaluated, mechanism of action & true active constituents are not known.

Taylor James A.,et al. Efficacy and Safety of **Echinacea** in Treating Upper Respiratory Tract Infections in Children. A Randomized Controlled Trial. JAMA. 2003;290:2824-2830. CONCLUSIONS: Echinacea purpurea, as dosed in this study, was not effective in treating URI symptoms in patients 2 to 11 years old, and its use was associated with an increased risk of rash.
Teschke Rolf; Schulze Johannes. Risk of **Kava Hepatotoxicity** and the FDA Consumer Advisory. *JAMA*. 2010;304(19):2174-2175.
Teschke R, Sarris J, Schweitzer I. Kava hepatotoxicity in traditional and modern use: the presumed Pacific kava paradox hypothesis revisited. Br J Clin Pharmacol. 2012 Feb;73(2):170-4.
Teschke R, Frenzel C, Glass X, et al. **Herbal hepatotoxicity**: A critical review. Br J Clin Pharmacol. 2012 Jul 26.
…accidental reexposure and/or thorough causality assessment methods have provided clear evidence for hepatotoxic properties of some herbal products, in addition to GC (4,5). Among

these are Ayurvedic herbs (38), Chaparral (12), Chinese herbal mixture (10,13,68), Germander (9,15), few Herbalife products (21,22), Ho Shou Wu (69), Jin Bu Huan (11,70), Kava (71), Ma Huang (72), Mistletoe (7), Senna (8), and Syo Saiko To (14). As opposed to these herbs and herbal products, causality could not be established for herbs such as black cohosh (BC) (36,39,57) and Pelargonium sidoides (PS) (64-67), using the CIOMS scale (33,35).

Timmer A, Gunther J, Motschall E, et al. **Pelargonium sidoides** extract for treating acute respiratory tract infections. Cochrane Database Syst Rev. 2013 Oct 22;10:CD006323. P. sidoides may be effective in alleviating symptoms of acute rhinosinusitis and the common cold in adults, but doubt exists. It may be effective in relieving symptoms in acute bronchitis in adults and children, and sinusitis in adults. The overall quality of the evidence was considered low for main outcomes in acute bronchitis in children and adults, and very low for acute sinusitis and the common cold. Reliable data on treatment for other ARIs were not identified.

Towheed TE, Maxwell L, Anastassiades TP, et al. **Glucosamine** therapy for treating osteoarthritis. Cochrane Database Syst Rev. 2005 Apr 18;(2):CD002946. CONCLUSIONS: This update includes 20 studies with 2570 patients. Pooled results from studies using a non-Rotta preparation or adequate allocation concealment failed to show benefit in pain and WOMAC function while those studies evaluating the Rotta preparation show that glucosamine was superior to placebo in the treatment of pain and functional impairment resulting from symptomatic OA. WOMAC outcomes of pain, stiffness and function did not show a superiority of glucosamine over placebo for both Rotta and non-Rotta preparations of glucosamine. Glucosamine was as safe as placebo.
