N Engl J Med. 2005 Dec 22;353(25):2643-53. (InfoPOEMs: This extension of the Diabetes Control and Complications Trial (DCCT) trial provides the first high-quality evidence that intensive treatment of Type 1 diabetes reduces the risk of adverse cardiovascular outcomes. Although the relative risk reduction was greater than 50%, the absolute risk reduction (0.42 per 100 patient years; NNT=25 over 10years) was modest. Note that this effect has not been shown in patients with Type 2 diabetes, although many patients and physicians believe otherwise, and data regarding all-cause mortality or adverse effects of intensive treatment (such as hypoglycemic episodes or traffic accidents) are not reported.. (LOE = 1b)) Diabetes Control and Complications Trial/Epidemiology of Diabetes Interventions and Complications (DCCT/EDIC) Research Group. Arch Intern Med. 2006 Feb 13;166(3):285-93. (InfoPOEMs: People interested in weight loss can choose either a low-fat, reduced calorie diet or a low-carbohydrate, non-calorie-restricted diet to lose a small but sustained amount of weight. The effect on cardiovascular outcomes of either diet are not known, though each has different effects on lipid levels, which may or may not translate into an actual effect on patient-oriented outcomes that matter. (LOE = 1a))

Norris SL, Kansagara D, Bougatsos C, Fu R; U.S. Preventive Services Task Force. **Screening adults** for type 2 diabetes: a review of the evidence for the U.S. Preventive Services Task Force. Ann Intern Med. 2008 Jun 3;148(11):855-68. Review. Summary for patients in: Ann Intern Med. 2008 Jun 3;148(11):I30. Direct evidence is lacking on the health benefits of detecting type 2 diabetes by either targeted or mass screening, and indirect evidence also fails to demonstrate health benefits for screening general populations. Persons with hypertension probably benefit from screening, because blood pressure targets for persons with diabetes are lower than those for persons without diabetes. Intensive lifestyle and pharmacotherapeutic interventions reduce the progression of prediabetes to diabetes, but few data examine the effect of these interventions on long-term health outcomes.

Orozco LJ, Buchleitner AM, Gimenez-Perez G, Roqué i Figuls M, Richter B, Mauricio D. **Exercise or exercise and diet for preventing type 2 diabetes mellitus**. Cochrane Database of Systematic Reviews 2008, Issue 3. Art. No.: CD003054. DOI:10.1002/14651858.CD003054.pub3. Interventions aimed at increasing exercise combined with diet are able to decrease the incidence of type 2 diabetes mellitus in high risk groups (people with impaired glucose tolerance or the metabolic syndrome). There is a need for studies exploring exercise only interventions and studies exploring the effect of exercise and diet on quality of life, morbidity and mortality, with special focus on cardiovascular outcomes.

Patel A; ADVANCE Collaborative Group, MacMahon S, Chalmers J, Neal B, et al. Effects of a fixed combination of perindopril and indapamide on macrovascular and microvascular outcomes in patients with type 2 diabetes mellitus (the **ADVANCE** trial): a randomised controlled trial. Lancet. 2007 Sep 8;370(9590):829-40. Routine administration of a fixed combination of perindopril and indapamide to patients with type 2 diabetes was well tolerated and reduced the risks of major vascular events, including death. Although the confidence limits were wide, the results suggest that over 5 years, one death due to any cause would be averted among every 79 patients assigned active therapy. (InfoPOEMs: Perindopril (Aceon) plus indapamide (Lozol) is better than placebo in decreasing clinically relevant events in patients with type 2 diabetes who are at high risk of cardiovascular complications. Whether the combination is better than other medications -- like aspirin -- isn't addressed by this study. (LOE = 1b))

Richter B, Bandeira-Echtler E, Bergerhoff K, Clar C, Ebrahim Sh. **Rosiglitazone** for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2007 Jul 18;(3):CD006063. Eighteen trials which randomised 3888 people to rosiglitazone treatment were identified. Longest duration of therapy was four years with a median of 26 weeks. Published studies of at least 24 weeks rosiglitazone treatment in people with type 2 diabetes mellitus did not provide evidence that patient-oriented outcomes like mortality, morbidity, adverse effects, costs and health-related quality of life are positively influenced by this compound. Metabolic control measured by glycosylated haemoglobin A1c (HbA1c) as a surrogate endpoint did not demonstrate clinically relevant differences to other oral antidiabetic drugs. Occurrence of oedema was significantly raised (OR 2.27, 95% confidence interval (CI) 1.83 to 2.81). The single large RCT (ADOPT - A Diabetes Outcomes Progression Trial) indicated increased cardiovascular risk.

Richter B, Bandeira-Echtler E, et al.. **Pioglitazone** for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2006 Oct 18;(4):CD006060. Until new evidence becomes available, the benefit-risk ratio of pioglitazone remains unclear. Different therapeutic indications for pioglitazone of the two big U.S. and European drug agencies should be clarified to reduce uncertainties amongst patients and physicians.

Saenz A, Fernandez-Esteban I, Mataix A, et al. Metformin monotherapy for type 2 diabetes mellitus. **Cochrane** Database Syst Rev. 2005 Jul 20;(3):CD002966. CONCLUSIONS: Metformin may be the first therapeutic option in the diabetes mellitus type 2 with overweight or obesity, as it may prevent some vascular complications, and mortality. Metformin produces beneficial changes in glycaemia control, and moderated in weight, lipids, insulinaemia and diastolic blood pressure. Sulphonylureas, alpha-glucosidase inhibitors, thiazolidinediones, meglitinides, insulin, and diet fail to show more benefit for glycaemia control, body weight, or lipids, than metformin.

Salpeter SR, Buckley NS, Kahn JA, Salpeter EE. Meta-analysis: **metformin** treatment in persons at **risk for diabetes mellitus**. Am J Med. 2008 Feb;121(2):149-157.e2. Using metformin to treat patients at risk for diabetes decreases their likelihood of developing diabetes over a 3-year period. Longer studies are needed to determine whether the likelihood of diabetes is truly decreased or simply delayed. We have no research to tell us whether, in the long run, patients live longer or live better if they are treated at this stage of (pre)diabetes. (LOE = 1a)

Valentine N, Van de Laar FA, van Driel ML. Adenosine-diphosphate (ADP) receptor antagonists (**clopidogrel, dipyridamole**) for the prevention of cardiovascular disease in type 2 **diabetes** mellitus. Cochrane Database Syst Rev. 2012 Nov 14;11:CD005449. doi: 10.1002/14651858.CD005449.pub2. The available evidence for ADP receptor antagonists in patients with diabetes mellitus is limited and most trials do not report outcomes for patients with diabetes separately.

van Dam RM, Hu FB. Coffee consumption and risk of type 2 diabetes. A systematic review. JAMA 2005; 294:97-104. (InfoPOEMs Habitual coffee drinking is associated with a reduced risk for type 2 diabetes. The lowest risk reduction occurred among individuals consuming 6 or more cups of filtered coffee daily. Decaffeinated and caffeinated brews are equally effective. (LOE = 2a-):)

Van de Laar FA, Lucassen PL, Akkermans RP, et al. Alpha-glucosidase inhibitors for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2005 Apr 18;(2):CD003639 & ACP Journal Club . AUTHORS' CONCLUSIONS: It remains unclear whether alpha-glucosidase inhibitors influence mortality or morbidity in patients with type 2 diabetes. Conversely, they have a significant effect on glycemic control and insulin levels, but no statistically significant effect on lipids and body weight. These effects are less sure when alpha-glucosidase inhibitors are used for a longer duration. Acarbose dosages higher than 50 mg TID offer no additional effect on glycated hemoglobin but more adverse effects instead. Compared to sulphonylurea, alpha-glucosidase inhibitors lower fasting and post-load insulin levels and have an inferior profile regarding glycemic control and adverse effects.

van der Heijden AA, Ortegon MM, Niessen LW, et al. Prediction of coronary heart disease risk in a general, pre-diabetic, and diabetic population during 10 years of follow-up: accuracy of the Framingham, SCORE, and UKPDS risk functions: The Hoorn Study. Diabetes Care. 2009 Nov;32(11):2094-8. The use of the Framingham function for prediction of the first CHD event is likely to overestimate an individual`s absolute CHD risk. In CHD prevention, application of the **SCORE and UKPDS** functions might be useful in the absence of a more valid tool.

Welschen LM, Bloemendal E, Nijpels G, Dekker JM, Heine RJ, Stalman WA, Bouter LM. Self-monitoring of blood glucose in patients with type 2 diabetes who are not using insulin. Diabetes Care 2005; 28:1510-17. (InfoPOEMs: Intensive monitoring of blood glucose in patients with type 2 diabetes not using insulin results in a small decrease in hemoglobin A1c (HbA1c) levels but does not change fasting blood glucose levels. Urine glucose monitoring works just as well. More casual monitoring of blood glucose, such as once a day, has not been studied. There is a strong possibility that the weak study design was largely responsible for the difference seen in the study. Blood glucose monitoring is expensive: At the intense level of monitoring used in some of these studies (6 times a day), the cost of the monitoring strips alone can be $2000 US per year. (LOE = 1a))

Wen CP, et al. Increased mortality risks of pre-diabetes (**impaired fasting glucose**) in Taiwan. Diabetes Care. 2005 Nov;28(11):2756-61. CONCLUSIONS: There was an overall J-shaped relationship between all-cause mortality and FBG. IFG, when defined as 110-125 mg/dl, is an independent risk factor and should be aggressively treated as a disease because its subsequent mortality risks for CVD and diabetes were significantly increased. The newly defined IFG at 100-125 mg/dl did not have the predictive power for later increases in CVD or diabetes mortality.

Weng J, Li Y, Xu W, et al. Effect of intensive insulin therapy on beta-cell function and glycaemic control in patients with newly diagnosed type 2 diabetes: a multicentre randomized parallel-group trial. Lancet. 2008 May 4;371(9626):1753-1760. Early intensive insulin therapy in patients with newly diagnosed type 2 diabetes has favourable outcomes on recovery and maintenance of beta-cell function and protracted glycaemic remission compared with treatment with oral hypoglycaemic agents.

Effectiveness and cost-effectiveness of **3-monthly versus 6-monthly monitoring** of well-controlled type 2 diabetes patients: a pragmatic randomised controlled patient-preference equivalence trial in primary care (EFFIMODI study). Diabetes Obes Metab. 2014 Mar 17.

Wernicke JF, et al. A randomized controlled trial of **duloxetine** in diabetic peripheral **neuropathic** pain. Neurology. 2006 Oct 24;67(8):1411-20. (InfoPOEMs: In this study, duloxetine (Cymbalta) 60 mg daily was more effective than placebo in reducing pain from neuropathy in pts with diabetes. Higher doses of duloxetine didn't provide much additional benefit. The biases in this study favor treatment, so it is likely that the real benefit is less than what these investigators observed. Finally, we don't know if duloxetine is any more effective than other treatments used for painful diabetic neuropathy. (LOE = 2b-))

Health Canada – Advisory on rosiglitazone (Avandia) (June 01, 2007) http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2007/avandia_hpc-cps_4_e.html

Important Advice for Managing Your Patients

In Canada, Avandia® is NOT approved for use:
- with insulin therapy
- with the combination of metformin AND a sulfonylurea
- in patients with pre-diabetes.

Avandia® is contraindicated in patients with NYHA Class III and IV cardiac status.
Avandia® should be used with caution in any patient with NYHA Class I and II cardiac status.
All patients should be monitored for signs and symptoms of fluid retention, edema, and rapid weight gain.

The dose of Avandia® used in combination with a sulfonylurea should not exceed 4mg daily.

Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. {From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.}

BMJ. 2012 Feb 27;344:e486. {SMBG does not appreciably improve control in T2DM patients not on insulin. ↓A1C only marginally 8.3%⇨8.05%.}

FDA Aug/10 and CDC have noted a progressive increase in the reports of bloodborne infection transmission over the past 10 to 15 years (primarily hepatitis B virus), resulting from shared use of fingerstick and point-of-care [POC] blood testing devices.

FDA Aug/13 Nova Diabetes Care initiated a voluntary recall of 21 lots of the Nova Max Glucose Test Strips distributed both in the USA and outside the continental USA.

FDA Jan/14 Nipro Diagnostics initiated a voluntary recall and replacement of a limited number of TRUEbalance and TRUEtrack Blood Glucose Meters distributed both in the United States and outside the United States. The company determined that certain isolated TRUEbalance and TRUEtrack Blood Glucose Meters have an incorrect factory-set unit of measure that displays the glucose result in mmoi/L rather than mg/dl. If a consumer were not to notice the incorrect unit of measure, it is possible that the meter result could be read as a lower than expected blood glucose result. BACKGROUND: There are 501 affected TRUEbalance meters and 105 affected TRUEtrack meters that were distributed in the United States from September 2008 to May 2013. The company is sending notifications to pharmacies, durable medical equipment providers, mail order companies and distributors where the TRUEbalance and TRUEtrack meters are recommended or sold in the United States.

FDA Mar/14 Abbott is conducting a recall for the FreeStyle Blood Glucose Meter and the FreeStyle Flash Blood Glucose Meter. When used with the Abbott FreeStyle test strips, the FreeStyle Blood Glucose Meter and the FreeStyle Flash Blood Glucose Meter may produce mistakenly low blood glucose results.

FDA Apr/14 is advising people with diabetes and health care professionals to stop using GenStrip Blood Glucose Test Strips because the strips may report incorrect blood glucose levels.

FDA Jun/14 Diabetic Supply of Suncoast, Inc. initiated a nationwide voluntary recall of all BMB-BA006A Advocate Redi-Code+ blood glucose test strip lots manufactured by BroadMaster Bio-Tech Corp due to a labeling error which could result in confusion about which meter models the Redi-Code+ BMB-BA006A blood glucose test strips are designed to be used with. In the incorrect labeling, the test strips model (BMB-BA006A) was omitted.

Medical Letter. Continuous Glucose Monitoring. May 2, 2011.
Ontario Aug 2013: introducing limitations in funding for diabetes test strips. And these new r estrictions are okay with the Canadian Diabetes Association, which worked with the government to ensure that new self-management of diabetes reflects the best evidence and clinical experience available. According to a notice posted on the Ontario Public Drug Programs (OPDP) website, research indicates that Blood Glucose Test Strips (BGTS) have a limited clinical benefit for many patients who don't take insulin. Based on this evidence, Ontario will restrict the number of BGTS allowed in a 365-day period, while ensuring continued access to those who need test strips to manage their blood sugar. The province's Health Network System (HNS) will track and determine the reimbursement level based on each patient's diabetes treatment. Under the new rules, patients managing diabetes with insulin will be allowed 3,000 BGTS a year, while patients managing diabetes with anti-diabetes medication with high risk of causing hypoglycemia will get 400 BGTS. Patients managing diabetes using anti-diabetes medication with low risk of causing hypoglycemia and those who are managing diabetes through diet/lifestyle therapy only will be allowed 200 BGTS.

Extras

Recently Discontinued Insulin Devices (within last 3 years): HumaPen Ergo (discontinued 2007) & Novolin-Pen 3

AutoPen 24 (3ml penfill) A) green – up to 21 units 1-21 units in 1 unit increments B) blue – up to 42 units 2-42 units in 2 unit increments		**LANTUS** (glargine) ◆ free with Lantus insulin	◆ has side-mounted injection button ◆ small white numbers on a dark background; does not have number window (e.g. number not magnified.) ◆ does NOT have dial back capabilities, dose must be wasted if overdialed ◆ if insufficient insulin in cartridge, number remaining on dial will show remaining dose to be given
Novolin-Pen Junior (3ml penfill) 1-35 units in ½ unit increments {Blue with green or yellow with green}		As per NovoPen 4 [Novo-Pen Junior being replaced by NovoPen Echo]	◆ small increments useful: children & insulin sensitive pts ◆ does NOT have dial back capability; barrel and cartridge holder should be pulled apart & button reset to correct dose ◆ small white numbers on a black background ◆ if insufficient insulin in cartridge, number remaining on dial will show remaining dose to be given
HumaPen Luxura (3ml cartridge) 1-60 units in 1 unit increments {Champagne or Burgundy with hard case}		**HUMULIN** (R, N, 30/70) **HUMALOG** (lispro) **HUMALOG** Mix25 (lispro+lispro protamine) **HUMALOG** Mix50 (lispro+lispro protamine) [HumanPen Luxura being replaced by HumaPen Savvio]	◆ has dial back capability, decreases wastage ◆ audible click on dialing doses ◆ dark numbers on a white background ◆ if insufficient insulin in cartridge, number remaining on dial will show remaining dose to be given ◆ Luxura last up to 6 years

Rosenstock J, Zinman B, Murphy LJ, et al. **Inhaled insulin** improves glycemic control when substituted for or added to oral combination therapy in type 2 diabetes: a randomized, controlled trial. Ann Intern Med. 2005 Oct 18;143(8):549-58. CONCLUSIONS: Inhaled insulin improved overall glycemic control and hemoglobin A1c level when added to or substituted for dual oral agent therapy with an insulin secretagogue and sensitizer. Consistent with other insulin therapies, hypoglycemia and mild weight gain occurred. Pulmonary function showed no between-group differences.

25. van den Berghe G, Wouters P, Weekers F, Verwaest C, Bruyninckx F,et al. Intensive insulin therapy in the **critically ill patients**. N Engl J Med. 2001 Nov 8;345(19):1359-67.
26. Van den Berghe G, Wilmer A, Hermans G, et al. Intensive insulin therapy in the **medical ICU**. N Engl J Med. 2006 Feb 2;354(5):449-61. CONCLUSIONS: Intensive insulin therapy significantly reduced morbidity but not mortality among all patients in the medical ICU. Although the risk of subsequent death and disease was reduced in patients treated for three or more days, these patients could not be identified before therapy. Further studies are needed to confirm these preliminary data. (InfoPOEMs: Intensive insulin treatment of patients in the medical intensive care unit (ICU) is helpful if patients spend at least 3 days in the unit. Unfortunately, those with a shorter stay may be harmed, and physicians were unable to accurately predict who would actually stay 3 or more days (36% of those predicted to stay at least 3 days were discharged sooner in this study). (LOE = 1b))
27. Nathan DM, et al.; Diabetes Control and Complications Trial/Epidemiology of Diabetes Interventions and Complications (**DCCT/EDIC**) Study Research Group. Intensive diabetes treatment and cardiovascular disease in patients with type 1 diabetes. N Engl J Med. 2005 Dec 22;353(25):2643-53. (InfoPOEMs: This extension of the Diabetes Control and Complications Trial (DCCT) trial provides the first high-quality evidence that intensive treatment of Type 1 diabetes reduces the risk of adverse cardiovascular outcomes. Although the relative risk reduction was greater than 50%, the absolute risk reduction (0.42 per 100 patient years; NNT=25 over 10years) was modest. Note that this effect has not been shown in patients with Type 2 diabetes, although many patients and physicians believe otherwise, and data regarding all-cause mortality or adverse effects of intensive treatment (such as hypoglycemic episodes or traffic accidents) are not reported.. (LOE = 1b))

32. Hermansen K, et al. A 26-week, randomized, parallel, treat-to-target trial **comparing insulin detemir with NPH** insulin as add-on therapy to oral glucose-lowering drugs in insulin-naive people with type 2 diabetes. Diabetes Care. 2006 Jun;29(6):1269-74. In both groups, 70% of participants achieved an A1C < or =7.0%, but the proportion achieving this without hypoglycemia was higher with insulin detemir than with NPH insulin (26 vs. 16%, P = 0.008). Compared with NPH insulin, the risk for all hypoglycemia with insulin detemir was reduced by 47% (P < 0.001) and nocturnal hypoglycemia by 55% (P < 0.001). Mean weight gain was 1.2 kg with insulin detemir and 2.8 kg with NPH insulin (P < 0.001), and the difference in baseline-adjusted final weight was -1.58 (P < 0.001).

51. Diabetes Control and Complications Trial/Epidemiology of Diabetes Interventions and Complications Study Research Group; (**DCCT/EDIC**) Jacobson AM, Musen G, Ryan CM, et al. Long-term effect of diabetes and its treatment on cognitive function. N Engl J Med. 2007 May 3;356(18):1842-52. **No evidence of substantial long-term declines in cognitive function** was found in a large group of patients with type 1 diabetes who were carefully followed for an average of 18 years, despite relatively high rates of recurrent severe hypoglycemia. Forty percent of the cohort reported having had at least one hypoglycemic coma or seizure.
52. Horvath K, Jeitler K, Berghold A, et al. Long-acting insulin analogues versus NPH insulin (human isophane insulin) for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2007 Apr 18;(2):CD005613. Our analysis suggests, if at all only a minor clinical benefit of treatment with long-acting insulin analogues for patients with diabetes mellitus type 2 treated with "basal" insulin regarding symptomatic nocturnal hypoglycaemic events. Until long-term efficacy and safety data are available, we suggest a cautious approach to therapy with **insulin glargine or detemir**.
53. Gandhi GY, Nuttall GA, Abel MD, et al. Intensive intraoperative insulin therapy versus conventional glucose management during cardiac surgery: a randomized trial. Ann Intern Med. 2007 Feb 20;146(4):233-43. Intensive insulin therapy during cardiac surgery does not reduce perioperative death or morbidity. The increased incidence of death and stroke in the intensive treatment group raises concern about routine implementation of this intervention.

56. Holman RR, Thorne KI, Farmer AJ, Davies MJ, Keenan JF, Paul S, et al.; the **4-T Study** Group. Addition of Biphasic, Prandial, or Basal Insulin to Oral Therapy in Type 2 Diabetes. (4T) N Engl J Med. 2007 Sep 21; [Epub ahead of print] A single analogue-insulin formulation added to metformin and sulfonylurea resulted in a glycated hemoglobin level of 6.5% or less in a minority of patients at 1 year. The addition of biphasic or prandial insulin aspart reduced levels more than the addition of basal insulin detemir but were associated with greater risks of hypoglycemia and weight gain. (InfoPOEMs: Patients choosing biphasic or prandial insulin regiments should be prepared to gain approximately **10 pounds to 12 pounds** and expect **4 to 8 moderate or severe episodes of hypoglycemia per year**. Basal insulin was a bit less effective as measured by the change in glycated hemoglobin (Hb A1C), but resulted in less weight gain & much less hypoglycemia. Of course, we don't know whether any of these regiments improve long-term clinical outcomes in these patients. If you are going to add insulin for a patient with poorly controlled Type 2 diabetes, it makes sense to start with a single dose of basal insulin for most patients, and to focus primarily on those patients with an initial Hb A1C of more than 8.5%. (LOE = 1b))

    Holman, Rury R., Farmer, Andrew J., Davies, Melanie J., et al. the 4-T Study Group, **Three-Year** Efficacy of Complex Insulin Regimens in Type 2 Diabetes**.**N Engl J Med 2009 0: NEJMoa0905479. Patients who added a basal or prandial insulin-based regimen to oral therapy had better glycated hemoglobin control than patients who added a biphasic insulin-based regimen. Fewer hypoglycemic episodes and less weight gain occurred in patients adding basal insulin.

JAMA. 2007 Sep 26;298(12):1420-8. Dietary intake of omega-3 fatty acids is associated with reduced risk of IA in children at increased genetic risk for type 1 diabetes.
59. Weston C, Walker L, Birkhead J; National Audit of Myocardial Infarction Project, National Institute for Clinical Outcomes Research. Early impact of insulin treatment on mortality for hyperglycaemic patients without known diabetes who present with an **acute coronary syndrome**. Heart. 2007 Dec;93(12):1542-6. Epub 2007 May 13. In non-diabetic patients with acute coronary syndrome and hyperglycaemia, treatment with insulin was associated with a reduction in the relative risk of death, evident within 7 days of admission, which persists at 30 days.
60. Datta S, Qaadir A, Villanueva G, Baldwin D. Once-daily insulin glargine versus 6-hour sliding scale regular insulin for control of hyperglycemia after a bariatric surgical procedure: a randomized clinical trial. Endocr Pract 2007;13(3):225-31.
61. Yeldandi RR, Lurie A, Baldwin D. Comparison of once-daily glargine insulin with twice-daily NPH/regular insulin for control of hyperglycemia in inpatients after cardiovascular surgery. Diabetes Technology & Therapeutics 2006;8(6):609-16.
62. Hofman PL, Lawton SA, Peart JM, et al. An angled insertion technique using 6-mm needles markedly reduces the risk of intramuscular injections in children and adolescents. Diabetic Medicine 2007;74(12):1400-1405. (InfoPOEMs: A pinched technique with angled insertion using 6-mm needles most reliably results in the appropriately placed subcutaneous injection of insulin in children with diabetes. This same needle-size used in the abdominal site also resulted in the least amount of injection pain. (LOE = 2b))
63. Goebel-Fabbri AE, Fikkan J, et al. **Insulin restriction and associated morbidity and mortality** in women with type 1 diabetes. Diabetes Care. 2008 Mar;31(3):415-9. Epub 2007 Dec 10. Our data demonstrate that insulin restriction is associated with increased rates of diabetes complications and increased mortality risk. Mortality associated with insulin restriction appeared to occur in the context of eating disorder symptoms, rather than other psychological distress.
64. Hassan K, Rodriguez LM, Johnson SE, et al. A randomized, controlled trial comparing twice-a-day insulin glargine mixed with rapid-acting insulin analogs versus standard neutral protamine Hagedorn (NPH) therapy in newly diagnosed type 1 diabetes. Pediatrics. 2008 Mar;121(3):e466-72. Epub 2008 Feb 25. Glycemic control with insulin glargine mixed with a rapid-acting insulin analog given twice daily seems significantly more effective than the standard therapy in newly diagnosed type 1 diabetes. Furthermore, it decreases pain and burden of injections for children with diabetes by allowing patients to **mix glargine with rapid**-acting insulin analog.
65. Coustan DR. Pharmacological management of **gestational diabetes**: an overview. Diabetes Care. 2007 Jul;30 Suppl 2:S206-8. Review. Erratum in: Diabetes Care. 2007 Dec;30(12):3154.
66. Bretzel RG, Nuber U, Landgraf W, et al. **Once-daily basal insulin glargine** versus thrice-daily prandial insulin lispro in people with type 2 diabetes on oral hypoglycaemic agents (APOLLO): an open randomised controlled trial. Lancet. 2008 Mar 29;371(9618):1073-84. A therapeutic regimen involving the addition of either basal or prandial insulin analogue is equally effective in lowering haemoglobin A(1c). We conclude that insulin glargine provides a simple and effective option that is more satisfactory to patients than is lispro for early initiation of insulin therapy, since it was associated with a lower risk

of hypoglycaemia, fewer injections, less blood glucose self monitoring, and greater patient satisfaction than was insulin lispro.
67. Lopez X, Castells M, Ricker A, Velazquez EF, Mun E, Goldfine AB. **Human insulin analog--induced lipoatrophy**. Diabetes Care. 2008 Mar;31(3):442-4. Epub 2007 Dec 27. Tryptase-positive/chymase-postitive mast cells, known to be sensitive to sodium cromolyn, may contribute to the destructive immune process mediated in response to exogenous insulin. Mast cell stabilizing therapy with topical **cromolyn** may reverse early and prevent new **lipoatrophic** lesions.
68. Cope JU, Morrison AE, Samuels-Reid J. Adolescent use of **insulin** and patient-controlled analgesia **pump** technology: a 10-year Food and Drug Administration retrospective study of adverse events. Pediatrics. 2008 May;121(5):e1133-8. A total of 1674 reports were identified: 1594 for insulin pumps and 53 for patient-controlled analgesic pumps. In reports of insulin pump events, there were 13 reported deaths, 2 reports that indicated possible suicide attempts, and several additional reports indicating severe hypoglycemic or hyperglycemic events that seemed to be device-related.

Epub 2008 Apr 29. Four subjects (Group 1) received the Edmonton immunosuppression regimen (daclizumab, sirolimus, tacrolimus). Six subjects (Group 2) received the University of Illinois protocol (etanercept, exenatide and the Edmonton regimen).Combined treatment of etanercept and exenatide improves islet graft function and facilitates achievement of insulin-independence with less islets.
74. Vardi M, Jacobson E, Nini A, Bitterman H. Intermediate acting versus long acting insulin for type 1 diabetes mellitus. Cochrane Database Syst Rev. 2008 Jul 16;(3):CD006297. Long acting insulin preparations seem to exert a beneficial effect on nocturnal glucose levels. Their effect on the overall diabetes control is clinically unremarkable. Their use as a basal insulin regimen for type 1 diabetes mellitus warrants further substantiation.
75. Rosenstock J, Davies M, Home PD, Larsen J, Koenen C, et al. A randomised, 52-week, treat-to-target trial comparing **insulin detemir with insulin glargine** when administered as add-on to glucose-lowering drugs in insulin-naive people with type 2 diabetes. Diabetologia. 2008 Jan 16; [Epub ahead of print] Supplementation of oral agents with detemir or glargine achieves clinically important improvements in glycaemic control with low risk of hypoglycaemia. Non-inferiority was demonstrated for detemir using higher insulin doses (mainly patients on twice daily dosing); weight gain was somewhat reduced with once daily insulin detemir.
76. Soylemez Wiener R, Wiener DC, Larson RJ. Benefits and risks of **tight glucose control in critically ill** adults: a meta-analysis. JAMA. 2008 Aug 27;300(8):933-44. In critically ill adult patients, tight glucose control is not associated with significantly reduced hospital mortality but is associated with an increased risk of hypoglycemia.
77. de Boer IH, Kestenbaum B, Rue TC, et al. Diabetes Control and Complications Trial (**DCCT**)/Epidemiology of Diabetes Interventions and Complications (**EDIC**) Study Research Group. Insulin therapy, hyperglycemia, and hypertension in type 1 diabetes mellitus. Arch Intern Med. 2008 Sep 22;168(17):1867-73. Hyperglycemia is a risk factor for incident hypertension in type 1 diabetes, and intensive insulin therapy reduces the long-term risk of developing hypertension.
78. Qayyum R, Bolen S, Maruthur N, et al. Systematic Review: Comparative Effectiveness and Safety of Premixed Insulin Analogues in Type 2 Diabetes. Ann Intern Med. 2008 Sep 15. [Epub ahead of print]

85. Arabi YM, Dabbagh OC, Tamim HM, et al. Intensive versus conventional insulin therapy: a randomized controlled trial in medical and surgical **critically ill patients**. Crit Care Med. 2008 Dec;36(12):3190-7. Intensive insulin therapy was not associated with improved survival among medical surgical intensive care unit patients and was associated with increased occurrence of hypoglycemia. Based on these results, we do not advocate universal application of intensive insulin therapy in intensive care unit patients.
86. Esposito K, Ciotola M, Maiorino MI, et al. Addition of neutral protamine lispro insulin or insulin glargine to oral type 2 diabetes regimens for patients with suboptimal glycemic control: a randomized trial. Ann Intern Med. 2008 Oct 21;149(8):531-9. Similar glycemic control occurred with the addition of NPL or glargine insulin to oral regimens in patients with poorly controlled type 2 diabetes. Hypoglycemia was similar in the 2 groups, but sample size limited the ability to make a definite safety assessment.
87. Hollander P, Cooper J, Bregnhøj J, Pedersen CB. A 52-week, multinational, open-label, parallel-group, noninferiority, treat-to-target trial comparing **insulin detemir with insulin glargine** in a basal-bolus regimen with mealtime insulin aspart in patients with type 2 diabetes. Clin Ther. 2008 Nov;30(11):1976-87. When used as indicated as part of a basal-bolus regimen in patients with T2DM who had previously received other insulin and/or OAD regimens, detemir was noninferior to glargine in its effects on overall glycemic control. Both basal insulins were associated with clinically relevant reductions in hyperglycemia. Both were well tolerated, with no significant difference in the frequency of hypoglycemia or AEs.

CDR / CEDAC Final Recommendation for Insulin Glulisine (Apidra) – Feb 19, 2009: http://www.cadth.ca/media/cdr/complete/cdr_complete_Apidra_February-19-2009.pdf
CADTH: Starting Insulin in T2DM: http://www.cadth.ca/media/pdf/c1109-guide-to-starting-insulin-final-e.pdf

Temporary Extras:

◆{Pen devices: ↑'d portability, convenience & ease of use; but ↑ potential for contamination, needle sticks, malfunction & cost}

◆T1DM: A1C difference between SAIA and HI is less than 1/10th of the difference between intensive and conventional tx groups in the DCCT; based on this, expected NNT for 1 less retinopathy = 650 / year

◆Epidural Corticosteroids: expect ↑BG levels for a few days Even JL, Crosby CG, Song Y, McGirt MJ, Devin CJ. Effects of epidural steroid injections on blood glucose levels in patients with diabetes mellitus. Spine 2012;37(1):E46-50.

◆Insulin Pump (CSII): may allow for ↓A1C by 0.3-0.6%; ↓ insulin dose by 10-20%; potentially useful if ↑ A1C despite best attempt with MDI &/or who have continued disabling hypoglycemia. Also of use in 1st trimester of pregnancy, or before, if A1C <6.1% not achieved.

Malanda UL, Welschen LM, Riphagen II, et al. Self-monitoring of blood glucose in patients with type 2 diabetes mellitus who are not using insulin. Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.

Megia A, Naf S, Herranz L, et al. The usefulness of HbA1C in postpartum reclassification of gestational diabetes. BJOG. 2012 Apr 24.

Middleton P, Crowther CA, Simmonds L. Different intensities of glycaemic control for pregnant women with pre-existing diabetes. Cochrane Database Syst Rev. 2012 Aug 15;8:CD008540. In a very limited body of evidence, few differences in outcomes were seen between very tight and tight-moderate glycaemic control targets in pregnant women with pre-existing type 1 diabetes, including actual glycaemic control achieved. There is evidence of harm (increased pre-eclampsia, caesareans and birthweights greater than 90th centile) for `loose` control (FBG above 7 mmol/L). Future trials comparing interventions, rather than glycaemic control targets, may be more feasible particularly for pregnant women with type 2 diabetes.

[12] Rosenstock J, Davies M, Home PD, Larsen J, Koenen C, Schernthaner G. A randomised, 52-week, treat-to-target trial comparing insulin detemir with insulin glargine when administered as add-on to glucose-lowering drugs in insulin-naive people with type 2 diabetes. Diabetologia. 2008 Mar;51(3):408-16. {582 patients were randomly assigned to supplemental OD detemir (55% went on to require BID dosing) or OD glargine. Improvement in A1C and rates of hypoglycaemia were similar, but OD detemir had less weight gain than glargine (1.6kg difference). In those patients who required BID detemir: the benefit of decreased weight gain was lost and a higher daily dose was required. Average daily dose required was: glargine od 0.4 unit/kg, detemir od 0.52 unit/kg & detemir bid 1 unit/kg (Overall average detemir dose 0.78 unit/kg). More discontinuations occurred due to injection site reactions with detemir (4.5% vs 1.4%.}

FDA Aug/09 Patients with diabetes who take therapeutic products containing nonglucose sugars (e.g., peritoneal dialysis solution and some immunoglobulins) can have falsely elevated readings from blood glucose test strips that use glucose dehydrogenase pyrroloquinoline quinone (GDH-PQQ) technology, according to an FDA public health notification. The strips are in wide use, and we have provided a link to a listing of the affected products. The FDA cites 13 deaths associated with hypoglycemia not detected by the test strips, which cannot distinguish between lucose and other sugars such as maltose and xylose. Ten patients were receiving icodextrin peritoneal dialysis solution. The FDA advises physicians to avoid using GDH-PQQ test strips in health care facilities and to rely, instead, on laboratory assays of glucose — especially in patients taking the therapeutic products listed in the alert. Interfering products containing nonglucose sugars include icodextrin peritoneal dialysis solution, certain immunoglobulins, abatacept (Orencia, Bristol-Myers Squibb), tositumomab (Bexxar, GlaxoSmithKline), and any product containing or metabolized into maltose, galactose, or xylose. Several test strips and associated monitors use GDH-PQQ methodology: *ACCU-CHEK* (Roche), *FreeStyle* (Abbott Diabetes Care), *TRUEtest* (Home Diagnostics), *CoZmonitor* blood glucose module (for use with the *Deltec Cozmo* insulin pump, Smiths Medical MD), and *OmniPod* insulin management system (Insulet).

Holman RR, Thorne KI, Farmer AJ, Davies MJ, Keenan JF, Paul S, et al.; the 4-T Study Group. Addition of Biphasic, Prandial, or Basal Insulin to Oral Therapy in Type 2 Diabetes. (4T) N Engl J Med. 2007 Sep 21; [Epub ahead of print] A single analogue-insulin formulation added to metformin and sulfonylurea resulted in a glycated hemoglobin level of 6.5% or less in a minority of patients at 1 year. The addition of biphasic or prandial insulin aspart reduced levels more than the addition of basal insulin detemir but were associated with greater risks of hypoglycemia and weight gain. (InfoPOEMs: Patients choosing biphasic or prandial insulin regiments should be prepared to gain approximately 10 pounds to 12 pounds and expect 4 to 8 moderate or severe episodes of hypoglycemia per year. Basal insulin was a bit less effective as measured by the change in glycated hemoglobin (Hb A1C), but resulted in less weight gain & much less hypoglycemia. Of course, we don't know whether any of these regiments improve long-term clinical outcomes in these patients. If you are going to add insulin for a patient with poorly controlled Type 2 diabetes, it makes sense to start with a single dose of basal insulin for most patients, and to focus primarily on those patients with an initial Hb A1C of more than 8.5%. (LOE = 1b))

Holman, Rury R., Farmer, Andrew J., Davies, Melanie J., et al. the 4-T Study Group, Three-Year Efficacy of Complex Insulin Regimens in Type 2 Diabetes.N Engl J Med 2009 0: NEJMoa0905479. Patients who added a basal or prandial insulin-based regimen to oral therapy had better glycated hemoglobin control than patients who added a biphasic insulin-based regimen. Fewer hypoglycemic episodes and less weight gain occurred in patients adding basal insulin.

Malanda UL, Welschen LM, Riphagen II, et al. Self-monitoring of blood glucose in patients with type 2 diabetes mellitus who are not using insulin. Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.

Hemmingsen B, Lund SS, Gluud C, et al. Targeting intensive glycaemic control versus targeting conventional glycaemic control for type 2 diabetes mellitus. Cochrane Database of Systematic Reviews 2011, Issue 6. Art. No.: CD008143. DOI: 10.1002/14651858.CD008143.pub2. The included trials did not show significant differences for all-cause mortality and cardiovascular mortality when targeting intensive glycaemic control compared with conventional glycaemic control. Targeting intensive glycaemic control reduced the risk of microvascular complications while increasing the risk of hypoglycaemia. Furthermore, intensive glycaemic control might reduce the risk of non-fatal myocardial infarction in trials exclusively dealing with glycaemic control in usual care settings.

Cochrane Database of Systematic Reviews 2008, Issue 3. Art. No.: CD003054. DOI:10.1002/14651858.CD003054.pub3. Interventions aimed at increasing exercise combined with diet are able to decrease the incidence of type 2 diabetes mellitus in high risk groups (people with impaired glucose tolerance or the metabolic syndrome). There is a need for studies exploring exercise only interventions and studies exploring the effect of exercise and diet on quality of life, morbidity and mortality, with special focus on cardiovascular outcomes.

Extras

- ASCEND (A Study of Cardiovascular Events iN Diabetes) and ACCEPT-D (Aspirin and Simvastatin Combination for Cardiovascular Events Prevention Trial in Diabetes). These are large, ongoing studies that will enrol up to 15,000 participants with anticipated completion dates of 2011 and 2013, respectively.

ETDRS 5 yrs, n=3,711	T1DM & T2DM plus diabetic retinopathy; ~50% of pts with hx of CV disease <10% hx of MI or stroke	aspirin 2 x 325mg/day vs placebo	◆ 1°: all-cause mortality, 12.1 vs 14.9, RR 0.91 [99% CI, 0.75 to 1.11, p=0.24] ◆ 2°: cardiovascular mortality, 9.3 vs 11.2, RR 0.87 [99% CI, 0.7 to 1.1, p=0.12] ◆ 2°: fatal or non-fatal MI, 9.1 vs 12.3, RR 0.83 [99% CI, 0.66 to 1.04] ◆ 2°: fatal or non-fatal stroke, 4.5 vs 3.8, RR 1.17 [99% CI, 0.79 to 1.28] -no evidence of harmful effects of aspirin

ETDRS Investigators. Aspirin effects on mortality and morbidity in patients with diabetes mellitus. Early Treatment Diabetic Retinopathy Study Report 14. *JAMA* 1992; 268(10); 1292-1300.

- From Circulation 2010: Intervention patients experienced a decreased risk of nonfatal or fatal MI (RR 0.85, 95% CI 0.73–1.00). In contrast, stroke occurred more frequently with aspirin, although the difference was not statistically significant (RR 1.18, 99% CI 0.88 –1.58). Men appeared to derive more benefit from aspirin than women for prevention of MI (RR for men 0.74, 99% CI 0.54 –1.00; RR for women 0.91, 99% CI 0.65–1.28), but this difference was not statistically significant and could represent a chance finding.
- From CCS 2011: For the predetermined secondary endpoint of fatal or nonfatal MI, the difference was significant at 5 years (RR 0.72, 99% CI 0.55-0.95) but not at 7 years (RR 0.83, 99% CI 0.66-1.04).

Cochrane Database Syst Rev. 2013 Nov 11;11:CD008143. Although we have been able to expand the number of participants by 16% in this update, we still find paucity of data on outcomes and the bias risk of the trials was mostly considered high. Targeting intensive glycaemic control compared with conventional glycaemic control did not show significant differences for all-cause mortality and cardiovascular mortality. Targeting intensive glycaemic control seemed to reduce the risk of microvascular complications, if we disregard the risks of bias, but increases the risk of hypoglycaemia and serious adverse events.

[3] Li Z, Maglione M, Tu W, Mojica W,et al. Meta-analysis: pharmacologic treatment of **obesity**. Ann Intern Med. 2005 Apr 5;142(7):532-46. CONCLUSIONS: Sibutramine, orlistat, phentermine, probably diethylpropion, bupropion, probably fluoxetine, and topiramate promote modest weight loss when given along with recommendations for diet. Sibutramine and orlistat are the 2 most-studied drugs. (InfoPOEMs: On the basis of flimsy evidence of benefit, The American College of Physicians recommends drug therapy for the treatment of obesity. They also recommend gastric bypass surgery, performed by an experienced surgeon, for patients with marked obesity and other risk factors for premature death. (LOE = 5))

[5] Padwal R, Li SK, Lau DC. Long-term pharmacotherapy for obesity and overweight. **Cochrane** Database Syst Rev. 2004;(3):CD004094. REVIEWERS' CONCLUSIONS: Studies evaluating the long-term efficacy of anti-obesity agents are limited to orlistat and sibutramine. Both drugs appear modestly effective in promoting weight loss; however, interpretation is limited by high attrition rates. Longer and more methodologically rigorous studies of anti- obesity drugs that are powered to examine endpoints such as mortality and cardiovascular morbidity are required to fully evaluate any potential benefit of such agents.

[12] Saenz A, Fernandez-Esteban I, Mataix A, et al. Metformin monotherapy for type 2 diabetes mellitus. **Cochrane** Database Syst Rev. 2005 Jul 20;(3):CD002966. CONCLUSIONS: Metformin may be the first therapeutic option in the diabetes mellitus type 2 with overweight or obesity, as it may prevent some vascular complications, and mortality. Metformin produces beneficial changes in glycaemia control, and moderated in weight, lipids, insulinaemia and diastolic blood pressure. Sulphonylureas, alpha-glucosidase inhibitors, thiazolidinediones, meglitinides, insulin, and diet fail to show more benefit for glycaemia control, body weight, or lipids, than metformin.

[14] Despres, JP, Golay A, Sjostrom L. Effects of **rimonabant** on metabolic risk factors in overweight patients with dyslipidemia (**Rio-Lipids**). N Engl J Med 2005;353:2121-34. (Weight loss: 6.7kg at 1yr by repeated-measures method)
Pi-Sunyer FX, et al. RIO-North America Study Group. Effect of **rimonabant**, a cannabinoid-1 receptor blocker, on weight and cardiometabolic risk factors in overweight or obese patients: **RIO-North America**: a randomized controlled trial. JAMA. 2006 Feb 15;295(7):761-75. In this multicenter trial, treatment with 20 mg/d of rimonabant plus diet for **2 years** promoted modest but sustained reductions in weight and waist circumference and favorable changes in cardiometabolic risk factors. {InfoPOEMs: Rimonabant (Acomplia) is minimally effective for obese or overweight patients for achieving sustained weight loss. Less than half the subjects initially enrolled in this study completed the protocol at 1 year. Of those remaining in the study, only one fourth lost a clinically significant amount of weight (10% or more) and, as with other weight-loss drugs, the patients who stopped taking the medicine after 1 year regained the weight. (LOE = 1b-)
Van Gaal LF, Rissanen AM, Scheen AJ, et al. **RIO-Europe** Study Group. Effects of the cannabinoid-1 receptor blocker **rimonabant** on weight reduction and cardiovascular risk factors in overweight patients: 1-year experience from the RIO-Europe study. Lancet. 2005 Apr 16-22;365(9468):1389-97. Erratum in: Lancet. 2005 Jul 30-Aug 5;366(9483):370. (n=1507, weight loss at 1 year: placebo -1.8kg (±6.4), rimonabant 5mg/d -3.4kg (±5.7), rimonabant 20mg/d -6.6kg (±7.2) (p<0.001). {Medscape article on rimonabant in RIO-Diabetes: http://www.medscape.com/viewarticle/546739_print}
Christensen R, Kristensen PK, Bartels EM, Bliddal H, Astrup A. Efficacy and safety of the weight-loss drug rimonabant: a meta-analysis of randomised trials. Lancet. 2007 Nov 17;370(9600):1706-13. Our findings suggest that 20 mg per day rimonabant increases the risk of **psychiatric adverse events**--ie, depressed mood disorders and anxiety-despite depressed mood being an exclusion criterion in these trials. Taken together with the recent US Food and Drug Administration finding of increased risk of suicide during treatment with rimonabant, we recommend increased alertness by physicians to these potentially severe psychiatric adverse reactions. { InfoPOEMs Jan08: These authors searched several databases for double-blind randomized trials of rimonabant for weight loss in patients with a body mass index higher than 30 (27 if the patient also had an obesity-related comorbid condition such as diabetes). Two reviewers independently assessed the quality of the included studies using the Jadad score. The authors don't describe looking for unpublished studies. Four trials (4105 patients) were included in this analysis. After 1 year, patients taking rimonabant lost an average of 4.7 kg more than did those given placebo. Additionally, 25% of patients taking rimonabant lost at least 10% of their baseline weight compared with 7% of control patients (number needed to treat = 5.3; 95% CI, 4.8 - 6). However, patients taking rimonabant were more likely to have unspecified serious adverse events (4% vs 6%; number needed to treat to harm [NNTH] = 58; 95% CI, 33 - 295). Additionally, 3% of patients taking rimonabant developed depression compared with 1.4% of control patients (NNTH = 63; 95% CI, 41-150). Although it's not formally addressed in this study, the authors mention recent Food and Drug Administration reports of increased suicide risk in patients taking rimonabant.}

[39] Sjostrom L, Narbro K, Sjostrom CD, et al.; Swedish Obese Subjects Study (**SOS**). Effects of **bariatric surgery** on mortality in Swedish obese subjects. N Engl J Med. 2007 Aug 23;357(8):741-52. Bariatric surgery for severe obesity is associated with long-term weight loss and decreased overall mortality.
Sjostrom L, et al.; Swedish Obese Subjects (**SOS**) Study Scientific Group. Lifestyle, diabetes, and cardiovascular risk factors 10 years after bariatric surgery. N Engl J Med. 2004 Dec 23;351(26):2683-93. After two years, the weight had increased by 0.1 percent in the control group and had decreased by 23.4 percent in the surgery group (P<0.001). After 10 years, the weight had increased by 1.6 percent and decreased by 16.1 percent, respectively (P<0.001). Energy intake was lower and the proportion of physically active subjects higher in the surgery group than in the control group throughout the observation period. Two- and 10-year rates of recovery from diabetes, hypertriglyceridemia, low levels of high-density lipoprotein cholesterol, hypertension, and hyperuricemia were more favorable in the surgery group than in the control group, whereas recovery from hypercholesterolemia did not differ between the groups. The surgery group had lower 2- and 10-year incidence rates of diabetes, hypertriglyceridemia, and hyperuricemia than the control group; differences between the groups in the incidence of hypercholesterolemia and hypertension were undetectable.

Alley DE, Chang VW. The changing relationship of **obesity and disability**, 1988-2004. JAMA. 2007 Nov 7;298(17):2020-7. Recent cardiovascular improvements have not been accompanied by reduced disability within the obese older population. Rather, obese participants surveyed during 1999-2004 were more likely to report functional impairments than obese participants surveyed during 1988-1994, and reductions in ADL impairment observed for nonobese older individuals did not occur in those who were obese. Over time, declines in obesity-related mortality, along with a younger age at onset of obesity, could lead to an increased burden of disability within the obese older population.

Curioni C, Andre C. **Rimonabant** for overweight or obesity. Cochrane Database Syst Rev. 2006 Oct 18;(4):CD006162. Compared with placebo, rimonabant 20 mg produced a 4.9 kg greater reduction in body weight in trials with one-year results. The use of rimonabant after one year produces modest weight loss of approximately 5%. Even modest amounts of weight loss may be potentially beneficial. The observed results should be interpreted with some caution, though, since the evaluated studies presented some deficiencies in methodological quality. Studies with longer follow-ups after the end of treatment and of more rigorous quality should be done before definitive recommendations can be made regarding the role of this new medication in the management of overweight or obese patients.

Dobbins M, Husson H, DeCorby K, et al. **School-based physical activity programs** for promoting physical activity and fitness in **children and adolescents** aged 6 to 18. Cochrane Database Syst Rev. 2013 Feb 28;2:CD007651. doi: 10.1002/14651858.CD007651.pub2. The evidence suggests the ongoing implementation of school-based physical activity interventions at this time, given the positive effects on behavior and one physical health status measure. However, given these studies are at a minimum of moderate risk of bias, and the magnitude of effect is generally small, these results should be interpreted cautiously. Additional research on the long-term impact is needed.

Can J Psychiatry. 2006 Jul;51(8):502-11. Review. Erratum in: Can J Psychiatry. 2006 Aug;51(9):620. Although difficult, the prevention of weight gain and the promotion of weight loss are possible for individuals treated with antipsychotic medications. Further research, including diabetes prevention studies, is required. We suggest a pathway for the management of weight gain and emerging metabolic disturbance.

FDA approves **Orlistat for OTC**, Pharmacist's Letter Mar 2007.

FDA Nov/08 Fashion Sanctuary announced a recall of **Zhen De Shou Fat Loss** Capsules because FDA analysis found the product to contain undeclared sibutramine, an FDA approved drug used as an appetite suppressant for weight loss.

FDA Jan/09 notified consumers not to take Venom **HYPERDRIVE 3.0**, a product sold as a dietary supplement but containing sibutramine.

FDA Mar/09 Herbal **Xenicol** (found to contain cetilistat, an obesity drug not approved in the U.S.) along with **Slimbionic** and **Xsvelten** (both containing sibutramine, a prescription-only weight loss drug) have been added to the list of tainted dietary supplements. There are now **72 products** on the list. http://www.fda.gov/bbs/topics/NEWS/2009/NEW01977.html

FDA Apr/09: **ABC Beauty Supply** & FDA notified consumers and healthcare professionals of a recall of 34 dietary supplement products. FDA lab analyses identified undeclared **sibutramine**, an FDA- approved drug, used as an appetite suppressant for weight loss. http://www.fda.gov/oc/po/firmrecalls/universalabc04_09.html **(34 products listed)**

FDA July/09 notified healthcare professionals that four weight loss dietary supplements sold and marketed by the firm (**Slimbionic, One Weight Loss Pill, SlimDemand Capsules, Botanical Weight Loss**) contain sibutramine.

FDA Aug/09 notified healthcare professionals and patients that it is reviewing new safety information regarding reports of liver-related adverse events in patients taking orlistat. **Orlistat** is marketed in the United States as a prescription product, Xenical, and as an over-the-counter (OTC) product, Alli. Between 1999 and October 2008, 32 reports of serious liver injury, including **6 cases of liver failure**, in patients using orlistat were submitted to FDA's Adverse Event Reporting System. The most commonly reported adverse events described in the 32 reports of serious liver injury were jaundice, weakness, and abdominal pain.

FDA Nov/09 & GMP Herbal Products notified consumers and healthcare professionals of a recall of **Pai You Guo**, a weight loss dietary supplement, due to the presence sibutramine & phenolphthalein **.**

FDA Jan/10 notified consumers and healthcare professionals about a counterfeit and potentially harmful version of **Alli 60 mg capsules** (120 count refill kit). The **counterfeit** version contained the controlled substance sibutramine and did not contain orlistat, the active ingredient.

FDA July/10 analysis of **Que She** found that it contains: fenfluramine – a stimulant drug withdrawn from the U.S. market in 1997 after studies demonstrated that it caused serious heart valve damage, propranolol – a prescription beta blocker drug that can pose a risk to people with bronchial asthma and certain heart conditions, sibutramine – a controlled substance and prescription weight loss drug, sibutramine was the subject of a recent study whose preliminary findings showed an association between sibutramine use and increased risk of heart attack and stroke in patients who have a history of heart disease, & ephedrine – a stimulant drug that is legally marketed over-the-counter for temporary relief of asthma but can pose a risk to people with certain cardiovascular conditions.

FDA Aug/10 lab analysis of **Solo Slim** was found to contain the undeclared drug ingredient Didesmethyl Sibutramine.

FDA July/10 lab analysis of **Slim-30** Herb Supplement distributed by the company was found to contain undeclared N-Desmethyl Sibutramine and traces of Sibutramine.

FDA July/10 lab analysis of this herb supplement, **Joyful Slim** Herb Supplement, was found to contain the undeclared drug, desmethyl sibutramine.

FDA Oct/10 notified consumers that **Slimming Beauty Bitter Orange Slimming Capsules** contain the active pharmaceutical ingredient sibutramine, a prescription-only drug which is a stimulant.

FDA Oct/10 Abbott Laboratories notified healthcare professionals and patients about the **voluntary withdrawal of Meridia (sibutramine)**, from the U.S. market because of clinical trial data indicating an increased risk of heart attack and stroke.

FDA Dec/10 has received multiple reports of adverse events associated with the use of **Fruta Planta**, including several cardiac events and one death. FDA laboratory analysis confirmed that Fruta Planta contains sibutramine.

FDA Jan/11 laboratory analysis confirmed that **Celerite Slimming Capsules** contain sibutramine

FDA Mar/11 lab analysis of **Svelte 30** orange & gray capsules determined that the product contains Sibutramine.

FDA Mar/11 notified Biotab Nutraceuticals, Inc. that two lots of counterfeit product purporting to be **Extenze** contain undeclared drug ingredients. Specifically, lot 0709241 contains tadalafil and sildenafil, and lot 0509075 contains tadalafil and sibutramine.

FDA Mar/11 laboratory analyses of **Celerite Slimming Tea**: Recall - were found to contain undeclared Sibutramine.

FDA May/11 laboratory analysis confirmed that "**Slim Xtreme Herbal Slimming Capsule**" contains sibutramine.

FDA July/11 is advising consumers not to purchase or use "**Slim Forte Slimming Capsules**," "**Slim Forte Slimming Coffee**," and "**Botanical Slimming Soft Gel & Slim Forte Double Power Slimming Capsules**. FDA laboratory analysis confirmed that these products contain sibutramine.

FDA Dec/11 took joint action against several companies selling over-the-counter **hCG products** that falsely and illegally claim to promote weight loss. Labeled "homeopathic" by the seven companies who received the letters, the products contain human chorionic gonadotropin (hCG), a hormone produced during pregnancy by cells that form the placenta. 1. HCG Diet Direct LLC- HCG Diet Homeopathic Drops, 2. The hCG Drops LLC- Homeopathic HCG, 3. HCG Platinum LLC; RightWay Nutrition- HCG Platinum, HCG Platinum X-30, HCG Platinum X-14, 4. Nutri Fusion Systems LLC- HCG Fusion 30, HCG Fusion 43, 5. www.resetthebody.com; www.theoriginalhcgdrops.com-Homeopathic Original HCG, Homeopathic HCG, 6. Hcg-miracleweightloss.com- HCG Extra Weight Loss Homeopathic Drops, 7. Natural Medical Supply- Alcohol Free hCG Weight Loss Formula.

FDA Feb/12 **Healthy People Co.** notified the public of a recall of the company's dietary supplements sold under the brand names Healthy People Co. FDA lab analysis confirmed the presence of Sibutramine and Tadalafil, making these products unapproved new drugs. (**Mince Belle Dietary Supplement, PERFECT Men Dietary Supplement , EVERLAX Dietary Supplement, EVER Slim Dietary Supplement, Herbal Drink Acai-man Mangosteen Dietary Supplement, EVER SLIM Shake Mix Dietary Supplement**)

FDA Feb/12 is advising consumers not to purchase or use "**Japan Weight Loss Blue**," a product for weight loss sold on various websites, laboratory analysis confirmed that "Japan Weight Loss Blue" contains sibutramine, analogs of sibutramine, and ephedrine alkaloids.

FDA Apr/12 laboratory analysis confirmed that "**Japan Rapid Weight Loss Diet Pills Yellow**" contains sibutramine and phenolphthalein.

FDA Oct/12 is advising consumers not to purchase or use "**Ultimate Formula Bee Pollen Capsules (Ultimate Formula)**," or "**Zi Xiu Tang Bee Pollen Capsules**," also referred to as "**Zi Xiu Tang Beauty, Face & Figure Capsule**," products promoted and sold for weight loss because they contain sibutramine.

FDA Dec/12 is advising consumers not to purchase or use "**SLIMDIA Revolution**," a product promoted and sold for weight loss on various websites, including www.pinkfatty.com, and in some retail stores since it contains Sibutramine.

FDA Jan/13 is advising consumers not to purchase or use "**MAXILOSS** Weight Advanced," a product promoted and sold for weight loss on various websites, includingwww.dreamlifeweightloss.com, and in some retail stores since it contains sibutramine.

FDA Feb/13 Olaax Corp announced a nationwide recall of the company's dietary supplement sold under the brand name **Maxiloss Weight Advanced Softgels** to the user level, because FDA testing found the Maxiloss Weight Advanced product to contain Sibutramine.

FDA Jun/13 FDA laboratory analysis confirmed that **"Bethel 30", & "XIYOUJI QINGZHI CAPSULE**" & **JaDera** contains sibutramine. .

FDA Jun/13 A sample of **Extreme Body Slim, Fat Zero, Fruit & Plant Slimming, & Paiyouji Plus** all contains silbutramine.

FDA Jun/13 Beta Labs has recalled certain lots of **Oxyphen, Phentalene, Phen FX, and Red Vipers** because they contain 1,3 dimethylamylamine (DMAA), the FDA announced over the weekend. The products are used as pre-workout stimulants and for weight loss, but the agency has previously warned that DMAA can be dangerous: it can elevate blood pressure and lead to cardiovascular complications. One distributor, GNC, faces FDA seizure of over 3000 cases of two other DMAA-containing products, **Jack3d and OxyElitePro**. Although the manufacturer of those supplements has ceased production, GNC continues to sell its remaining stocks, according to the *New York Times*.

FDA July/13 **Meizi Revolution, Strawberry Balance** contains silbutramine.

FDA Aug/13 Herbal Give Care LLC issued a voluntarily recall of all lots of **Esbelin silouttete** and **Esbelin silouttе Herbal Blend with L-Carnitine** (30 Capsules), to the consumer level. The products have been found to contain undeclared Sibutramine, N-Desmethylsibutramine, and N-di-Desmethylsibutramine.

FDA Aug/13 Bethel Nutritional Consulting, Inc., New York, NY, is voluntarily recalling **Quick Thin and Bethel Advance** to the consumer level. These products have been found to contain Sibutramine and Phenolphthalein, and may pose a threat to consumers.
FDA Aug/13 CTV Best Group announced that it is conducting a voluntary nationwide recall of all lots of a dietary supplement products distributed by the company under the names **BEST SLIM 40 Pills** to the consumer level. Testing by FDA revealed the presence of Sibutramine in Best Slim.
FDA Aig/13 Herbal Give Care LLC is voluntarily recalling all lots of **Esbelder man (30 capsules), Esbelder fem (30 capsules) and Esbelder siloutte** (30 capsules) to the consumer level. The products have been found to contain undeclared Sibutramine, N-Desmethylsibutramine, and N-di-Desmethylsibutramine.
FDA Sep/13 laboratory analysis confirmed that **Shou Fu Ti Tun Guo Xiang Xing Jian Fei Jiao Nang** contains sibutramine.
FDA Oct/13: B@B Trade, Inc., Florida is voluntarily recalling all lots of **Slim Fortune, Lidiy, and Slim Expert** to the consumer level. The FDA laboratory analysis of these dietary supplements found to contain undeclared Sibutramine.
FDA Oct/13 is advising consumers not to purchase or use **Perfect Body Solutions or Burn 7**. FDA laboratory analyses confirmed that Perfect Body Solutions and Burn 7 contain sibutramine.
FDA Oct/13 is advising consumers not to purchase or use **Dr. Mao Slimming Capsules**. FDA laboratory analysis confirmed that Dr. Mao Slimming Capsules contain sibutramine.
FDA Oct/13 is advising consumers not to purchase or use **Bella Vi Insane Amp'd or Bella Vi Amp'd Up.** FDA laboratory analyses confirmed that Bella Vi Insane Amp'd and Bella Vi Amp'd Up contain sibutramine.
FDA Nov/13 **SlimExtra Herbal** capsules contain silbutramine.
FDA Dec/13 laboratory analysis found the **Burn 7 Capsules** to contain undeclared Sibutramine.
FDA Jan/14 is advising consumers not to purchase or use **Magic Slim or Dream Body Slimming Capsule**, products promoted and sold for weight loss and sold on various websites and in some stores, since FDA lab analysis confirmed they contains sibutramine.
FDA Jan/14 **Citrus Fit Gold, Hot Detox & Thinogenics** contains sibutramine. **Tonic Life BP** contains phenolphthalein.
FDA Feb/14: MyNicKnaxs, LLC notified the public it is recalling all lots of "**Reduce Weight Fruta Planta**". FDA lab analysis of the product found Reduce Weight Fruta Planta to contain 10.2 mg of Phenolphthalein.
FDA Mar/14 is advising consumers not to purchase or use **Vitaccino Coffee**, a product promoted and sold for weight loss. FDA laboratory analysis confirmed that Vitaccino Coffee contains sibutramine.
FDA Mar/14: New Life Nutritional Center is recalling all lots of "**Super Fat Burner capsules, Maxi Gold capsules and Esmeralda softgels**" to the user level after FDA analysis revealed the products contain undeclared active pharmaceutical ingredients: sibutramine, phenolphthalein or a combination of both sibutramine and phenolphthalein.
FDA Mar/14: **Bella Vi Insane Bee Pollen Capsules, Bella Vi BTrim Ultimate Boost, Bella Vi BTrim Max, Bella Vi Extreme Accelerator, Bella Vi Insane Amp'd, and Bella Vi Amp'd U**, contain silbutramine with or without phenolphthalein.
FDA Mar/14: GlaxoSmithKline (GSK) Consumer Healthcare is **voluntarily recalling** all alli weight loss products from U.S. and Puerto Rico retailers as the company believes that some packages of the product were tampered with and may contain product that is not authentic **Alli**.
FDA Apr/14: FDA analysis on **New You** contains silbutramine.
FDA Apr/14 has tested multiple **Zi Xiu Tang Bee Pollen** products from various distributors in the United States (US). All products that have been tested, including those that claim to be "genuine" and "anti-counterfeit," have been found to contain one or both of the undeclared drug ingredients sibutramine and Phenolphthalein.
FDA Apr/14 laboratory analysis confirmed that **Infinity & Lite Fit** USA contains sibutramine.
FDA Apr/14: Nature's Universe notified the public it is recalling all lots of **Thinogenics** product sold prior to February 6, 2014 to the user level after FDA analysis revealed that the affected product contained undeclared sibutramine.
FDA May/14 laboratory analysis confirmed that **Slim Trim U & Natural Body Solution** contains sibutramine.
FDA May/14 is advising consumers not to purchase or use **Asset Bee Pollen**, a product promoted and sold for weight loss because it contains sibutramine.
FDA May/14 is advising consumers not to purchase or use **Asset Bold**, a product promoted and sold for weight loss. FDA laboratory analysis confirmed that Asset Bold contains sibutramine.
FDA Jun/14 laboratory analysis confirmed that **La Jiao Shou Shen** contains sibutramine
FDA Jun/14 laboratory analysis confirmed that **Sliming Diet** contains sibutramine.

MHRA Feb/12 Herbal sliming products found to contain potentially dangerous undeclared pharmaceuticals: **Expelling Grease Slimming Abdomen, V12 Fruit Slimming, 100% Natural Weight Loss Coffee, Leisure 18 Slimming Orange Juice, Fashion Slimming Milk Shake, Langli, Ya Buk & Fruit and vegetables lose weight**. MHRA has received advice from the Danish Medicines Agency that these unlicensed products have been tested and found to contain the Prescription Only Medicine Sibutramine.

MHRA Feb/12 Following a safety alert issued in October 2010 about slimming products containing Paiyouji the Agency has received a further complaint about a product called **'Paiyouji Plus - Fast Acting Slimming Tea'**. This product has been tested by the Agency and, as in the case of other Paiyouji products, found to contain sibutramine.

MHRA Nov/12 has received advice from the Danish Medicines Agency that this unlicensed product, **Ultra Slim** has been tested and found to contain the Prescription Only Medicine Sibutramine.

MHRA Feb/13 is advising consumers not to use the products specified below due to sibutramine content. Product: **Fashion Slimming Coffee, L-Carnitine + P57, L-CarnitinL 360 Slimming Coffee, Brazil Potent Slimming Coffee sachets, Coffee 26 Original sachets, Coffee Nature Fashion Slimming sachets, Slender Capsule, Slim-1.**

Ogden CL, Carroll MD, Flegal KM. High body mass index for age among **US children and adolescents, 2003-2006**. JAMA. 2008 May 28;299(20):2401-5. The prevalence of high BMI for age among children and adolescents showed no significant changes between 2003-2004 and 2005-2006 and no significant trends between 1999 and 2006.

Ogden CL, Carroll MD, Curtin LR, McDowell MA, Tabak CJ, Flegal KM. **Prevalence** of overweight and obesity in the **United States, 1999-2004**. JAMA. 2006 Apr 5;295(13):1549-55. The prevalence of overweight among children and adolescents and obesity among men increased significantly during the 6-year period from 1999 to 2004; among women, no overall increases in the prevalence of obesity were observed. These estimates were based on a 6-year period and suggest that the increases in body weight are continuing in men and in children and adolescents while they may be leveling off in women.

Oude Luttikhuis H, Baur L, Jansen H, Shrewsbury VA, O'Malley C, Stolk RP, Summerbell CD. Interventions for treating **obesity in children. Cochrane** Database Syst Rev. 2009 Jan 21;(1):CD001872. While there is limited quality data to recommend one treatment program to be favoured over another, this review shows that combined behavioural lifestyle interventions compared to standard care or self-help can produce a significant and clinically meaningful reduction in overweight in children and adolescents. In obese adolescents, consideration should be given to the use of either orlistat or sibutramine, as an adjunct to lifestyle interventions, although this approach needs to be carefully weighed up against the potential for adverse effects.

Preganancy: May/09 Obese women (BMI, 30 or higher) should gain only 11 to 20 pounds during a singleton pregnancy, according to new guidelines from the Institute of Medicine. The guidelines update the IOM's previous recommendations, issued in 1990. The group continues to recommend that: underweight women (BMI lower than 18.5) gain 28-40 pounds; normal-weight women (BMI, 18.5-24.9) gain 25-35 pounds; overweight women (BMI, 25.0-29.9) gain 15-25 pounds. Weight gain should be higher for multiple pregnancies. Excessive weight gain, the IOM notes, is associated with increased risk for gestational diabetes, pregnancy-associated hypertension, and delivery of large-for-gestational-age infants, among other outcomes. The group says that clinicians should supplement these guidelines with individualized counseling about diet and exercise. In addition, preconception counseling should stress the importance of conceiving at a normal BMI. http://www.iom.edu/Object.File/Master/68/110/Report%20Brief%20-%20Weight%20Gain%20During%20Pregnancy.pdf

BMJ. 2007 Dec 1;335(7630):1134. Epub 2007 Nov 6. Increasing body mass index is associated with a significant increase in the risk of cancer for 10 out of 17 specific types examined. Among postmenopausal women in the UK, 5% of all cancers (about 6000 annually) are attributable to being overweight or obese. For endometrial cancer and adenocarcinoma of the oesophagus, body mass index represents a major modifiable risk factor; about half of all cases in postmenopausal women are attributable to overweight or obesity.

Rucker D, Padwal R, Li SK, Curioni C, Lau DC. Long term **pharmacotherapy** for obesity and overweight: **updated meta-analysis**. BMJ. 2007 Nov 15; [Epub ahead of print] Attrition rates averaged 30-40%. Compared with placebo, orlistat reduced weight by 2.9 kg (95% confidence interval 2.5 kg to 3.2 kg), sibutramine by 4.2 kg (3.6 kg to 4.7 kg), and rimonabant by 4.7 kg (4.1 kg to 5.3 kg). Patients receiving active drug treatment were significantly more likely to achieve 5% and 10% weight loss thresholds. Orlistat reduced the incidence of diabetes and improved concentrations of total cholesterol and low density lipoprotein cholesterol, blood pressure, and glycaemic control in patients with diabetes but increased rates of gastrointestinal side effects and slightly lowered concentrations of high density lipoprotein. Sibutramine lowered concentrations of high density lipoprotein cholesterol and triglycerides but raised blood pressure and pulse rate. Rimonabant improved concentrations of high density lipoprotein cholesterol and triglycerides, blood pressure, and glycaemic control in patients with diabetes but increased the risk of mood disorders. Orlistat, sibutramine, and rimonabant modestly reduce weight, have differing effects on cardiovascular risk profiles, and have specific adverse effects.

Sjostrom L, et al.; Swedish Obese Subjects (**SOS**) Study Scientific Group. Lifestyle, diabetes, and cardiovascular risk factors 10 years after bariatric surgery. N Engl J Med. 2004 Dec 23;351(26):2683-93. After two years, the weight had increased by 0.1 percent in the control group and had decreased by 23.4 percent in the surgery group (P<0.001). After 10 years, the weight had increased by 1.6 percent and decreased by 16.1 percent, respectively (P<0.001). Energy intake was lower and the proportion of physically active subjects higher in the surgery group than in the control group throughout the observation period. Two- and 10-year rates of recovery from diabetes, hypertriglyceridemia, low levels of high-density lipoprotein cholesterol, hypertension, and hyperuricemia were more favorable in the surgery group than in the control group, whereas recovery from hypercholesterolemia did not differ between the groups. The surgery group had lower 2- and 10-year incidence rates of diabetes, hypertriglyceridemia, and hyperuricemia than the control group; differences between the groups in the incidence of hypercholesterolemia and hypertension were undetectable.

Some food groups in the Mediterranean diet are more important than others in promoting health and longer life, according to this prospective cohort study from the Greek segment of the European Prospective Investigation into Cancer and nutrition (EPIC). The researchers investigated the importance of individual components of the diet and found that eating more vegetables, fruits, nuts, pulses, and olive oil, and drinking moderate amounts of alcohol is linked to people living longer, whereas following a Mediterranean diet high in seafood and cereals and low in dairy products was not an indicator of longevity.

Energy Drinks

Health Canada: Safe Use of Energy Drinks. Accessed online at http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/food-aliment/boissons-energ-drinks-eng.php. {Excessive drinking of energy drinks or mixing them with alcohol can have serious health effects. Energy drinks are meant to supply mental and physical stimulation for a short period of time. They usually contain caffeine, taurine (an amino acid, one of the building blocks of protein), vitamins and glucuronolactone, a carbohydrate. Energy drinks should not be confused with sports drinks such as Gatorade® or Powerade®. Sports drinks re-hydrate the body and provide sugars, which the body burns to create energy and replenish electrolytes.}

Glucomannan (in PGX PolyGlycopleX) Plant fibre water-soluble: unabsorbable polysaccharide (glucose + mannose). May ↓LDL, ↓gastric emptying & improve BG control. Conflicting evidence. SE: gas, bloating, etc.

FDA Dec/08 alerted consumers nationwide not to purchase or consume more than **25 different products** marketed for weight loss because they contain undeclared, active pharmaceutical ingredients that may put consumers' health at risk. The undeclared active pharmaceutical ingredients in some of these products include sibutramine (a controlled substance), rimonabant (a drug not approved for marketing in the United States), phenytoin (an anti-seizure medication), and phenolphthalein (a solution used in chemical experiments and a suspected cancer causing agent). The weight loss products, some of which are marked as "dietary supplements," are promoted and sold on various web sites and in some retail stores. FDA advises consumers who use the

products to stop taking them and consult their healthcare professional immediately as the health risks posed by these products can be serious (for example, high blood pressure, seizures, tachycardia, palpitations, heart attack or stroke). FDA also encourages consumers to seek guidance from healthcare professional before purchasing weight loss products. See the FDA News Release for a listing of the names of the 25 referenced products. Read the MedWatch 2008 safety summary, including links to http://www.fda.gov/medwatch/safety/2008/safety08.htm#Weight

FDA May/09 warned consumers to immediately stop using **Hydroxycut products by Iovate Health Sciences**, Inc. Hydroxycut products are associated with a number of **serious liver injuries**. Hydroxycut products are dietary supplements that are marketed for weight-loss, as fat burners, as energy-enhancers, as low carb diet aids, and for water loss under the Iovate and MuscleTech brand names. FDA has received 23 reports of serious health problems ranging from jaundice and elevated liver enzymes, an indicator of potential liver injury, to liver damage requiring liver transplant. One death due to liver failure has been reported to FDA. Other health problems reported include seizures; cardiovascular disorders; and rhabdomyolysis, a type of muscle damage that can lead to other serious health problems such as kidney failure.

FDA Jan/10 notified consumers and healthcare professionals about a counterfeit and potentially harmful version of **Alli 60 mg capsules** (120 count refill kit). The **counterfeit version** contained the controlled substance sibutramine and did not contain orlistat, the active ingredient.

FDA July/10 analysis of **Que She** found that it contains: fenfluramine – a stimulant drug withdrawn from the U.S. market in 1997 after studies demonstrated that it caused serious heart valve damage, propranolol – a prescription beta blocker drug that can pose a risk to people with bronchial asthma and certain heart conditions, sibutramine – a controlled substance and prescription weight loss drug, sibutramine was the subject of a recent study whose preliminary findings showed an association between sibutramine use and increased risk of heart attack and stroke in patients who have a history of heart disease, & ephedrine –a stimulant drug that is legally marketed over-the-counter for temporary asthma relief but can pose a risk to people with cardiovascular disease.

FDA Aug/10 lab analysis of **Solo Slim** was found to contain the undeclared drug ingredient Didesmethyl Sibutramine.

FDA July/10 lab analysis of **Slim-30** Herb Supplement distributed by the company was found to contain undeclared N-Desmethyl Sibutramine & Sibutramine.

FDA July/10 lab analysis of this herb supplement, **Joyful Slim** Herb Supplement, was found to contain the undeclared drug, desmethyl sibutramine.

FDA Oct/10 notified consumers that **Slimming Beauty Bitter Orange Slimming Capsules** contain sibutramine, a prescription-only drug which is a stimulant.

FDA Dec/10 has received multiple reports of adverse events associated with the use of **Fruta Planta**, including several cardiac events and one death. FDA lab analysis confirmed that Fruta Planta contains sibutramine.

FDA Jan/11 laboratory analysis confirmed that **Celerite Slimming Capsules** contain sibutramine

FDA Mar/11 lab analysis of **Svelte 30** orange & gray capsules determined that the product contains Sibutramine.

FDA Mar/11 notified Biotab Nutraceuticals, Inc. that two lots of counterfeit product purporting to be **Extenze** contain undeclared drug ingredients. Specifically, lot 0709241 contains tadalafil and sildenafil, and lot 0509075 contains tadalafil and sibutramine.

FDA Mar/11 laboratory analyses of **Celerite Slimming Tea**: Recall - were found to contain undeclared Sibutramine.

FDA May/11 laboratory analysis confirmed that "**Slim Xtreme Herbal Slimming Capsule**" contains sibutramine.

FDA July/11 is advising consumers not to purchase or use "**Slim Forte Slimming Capsules**," "**Slim Forte Slimming Coffee**," and "**Botanical Slimming Soft Gel & Slim Forte Double Power Slimming Capsules**. FDA laboratory analysis confirmed that these products contain sibutramine.

FDA Dec/11 took joint action against several companies selling over-the-counter **hCG products** that falsely and illegally claim to promote weight loss. Labeled "homeopathic" by the seven companies who received the letters, the products contain human chorionic gonadotropin (hCG), a hormone produced during pregnancy by cells that form the placenta. 1. HCG Diet Direct LLC- HCG Diet Homeopathic Drops, 2. The hCG Drops LLC- Homeopathic HCG, 3. HCG Platinum LLC; RightWay Nutrition- HCG Platinum, HCG Platinum X-30, HCG Platinum X-14, 4. Hcg-miracleweightloss.com- HCG Extra Weight Loss Homeopathic Drops, 7. Natural Medical Supply- Alcohol Free hCG Weight Loss Formula.

FDA Feb/12 is advising consumers not to purchase or use "**Japan Weight Loss Blue**," a product for weight loss sold on various websites, laboratory analysis confirmed that "Japan Weight Loss Blue" contains sibutramine, analogs of sibutramine, and ephedrine alkaloids.

FDA Apr/12 laboratory analysis confirmed that "**Japan Rapid Weight Loss Diet Pills Yellow**" contains sibutramine and phenolphthalein.

FDA Dec/12 is advising consumers not to purchase or use "SLIMDIA Revolution," a product promoted and sold for weight loss on various websites, including www.pinkfatty.com, and in some retail stores since it contains Sibutramine.

FDA Jan/13 is advising consumers not to purchase or use "**MAXILOSS** Weight Advanced," a product promoted and sold for weight loss on various websites, includingwww.dreamlifeweightloss.com, and in some retail stores since it contains sibutramine.

FDA Feb/13 Olaax Corp announced a nationwide recall of the company's dietary supplement sold under the brand name **Maxiloss Weight Advanced Softgels** to the user level, because FDA testing found the Maxiloss Weight Advanced product to contain Sibutramine.

MHRA Feb/12 Herbal sliming products found to contain potentially dangerous undeclared pharmaceuticals: **Expelling Grease Slimming Abdomen, V12 Fruit Slimming, 100% Natural Weight Loss Coffee, Leisure 18 Slimming Orange Juice, Fashion Slimming Milk Shake, Langli, Ya Buk & Fruit and vegetables lose weight**. MHRA has received advice from the Danish Medicines Agency that these unlicensed products have been tested and found to contain the Prescription Only Medicine Sibutramine.

MHRA Feb/12 Following a safety alert issued in October 2010 about slimming products containing Paiyouji the Agency has received a further complaint about a product called '**Paiyouji Plus - Fast Acting Slimming Tea**'. This product has been tested by the Agency and, as in the case of other Paiyouji products, found to contain sibutramine.

MHRA Nov/12 has received advice from the Danish Medicines Agency that this unlicensed product, **Ultra Slim** has been tested and found to contain the Prescription Only Medicine Sibutramine.

MHRA Feb/13 is advising consumers not to use the products specified below due to sibutramine content. Product names: **Fashion Slimming Coffee, L-Carnitine + P57, L-CarnitinL 360 Slimming Coffee, Brazil Potent Slimming Coffee sachets, Coffee 26 Original sachets, Coffee Nature Fashion Slimming sachets, Slender Capsule, Slim-1.**

FDA Propylthiouracil-Induced Liver Failure June/09 FDA has identified 32 AERS cases (22 adult and 10 pediatric) of serious liver injury associated with propylthiouracil use. Of the adult cases, 12 deaths and 5 liver transplants occurred. Among the pediatric patients, 1 case resulted in death and 6 in liver transplants. In contrast, for methimazole 5 AERS cases of serious liver injury were identified. All five cases were in adult patients and 3 resulted in death. (**April 21, 2010**: Propylthiouracil: FDA has added a Boxed Warning to the label for propylthiouracil, to include information about reports of severe liver injury and acute liver failure, some of which have been fatal, in adult and pediatric patients using this medication. A boxed warning has been added to the hyperthyroidism drug propylthiouracil (PTU) to alert clinicians about the drug's risk for severe liver injury, the FDA announced on Wednesday. The new labeling is based in part on postmarketing safety reports of severe liver injury — including 15 deaths — in 23 adult and 11 pediatric patients taking PTU. A warning about the potential dangers of the drug was issued by the agency last June. The FDA recommends that PTU only be used in patients who cannot tolerate methimazole or other treatments for hyperthyroidism and in women just before and during their first trimester of pregnancy. Patients will now receive a medication guide upon filling a prescription for PTU. FDA drug safety communication)

Bach-Huynh TG, Nayak B, Loh J, et al. Timing of Levothyroxine Administration Affects Serum Thyrotropin Concentration. J Clin Endocrinol Metab. 2009 Jul 7. [Epub ahead of print]. Non-fasting regimens of levothyroxine administration are associated with higher and more variable serum thyrotropin concentrations. If a specific serum thyrotropin goal is desired, thereby avoiding iatrogenic subclinical thyroid disease, then fasting ingestion of levothyroxine ensures that thyrotropin concentrations remain within the narrowest target range.

Levothyroxine treatment of clinical hypothyroidism in pregnancy is already standard practice given the documented benefits from earlier non-randomised studies. Whether levothyroxine should be utilised in autoimmune and subclinical hypothyroidism remains to be seen, but it may prove worthwhile, given a possible reduction in preterm birth and miscarriage.Selenomethionine as an intervention in women with thyroid autoantibodies is promising, particularly in reducing postpartum thyroiditis. There is a probable low incidence of adverse outcomes from levothyroxine and selenomethionine. High-quality evidence is lacking and large-scale randomised trials are urgently needed in this area. Until evidence for or against universal screening becomes available, targeted thyroid function testing in pregnancy should be implemented in women at risk of thyroid disease and levothyroxine utilised in hypothyroid women.
Reid SM, Middleton P, Cossich MC, et al. Interventions for **clinical and subclinical hypothyroidism pre-pregnancy and during pregnancy**. Cochrane Database Syst Rev. **2013** May 31;5:CD007752. doi: 10.1002/14651858.CD007752.pub3. This review found no difference between levothyroxine therapy and a control for treating pregnant euthyroid women with thyroid peroxidase antibodies for the outcome of pre-eclampsia, however a reduction in preterm birth and a trend towards reduced miscarriage with levothyroxine was shown. This review also showed no difference for pre-eclampsia or preterm birth when selenium was compared with placebo, however a promising reduction in postpartum thyroiditis was shown. Childhood neurodevelopmental delay was not assessed by any trial included in the review.Given that this review is based on four trials of moderate risk of bias, with only two trials contributing data (n = 284), there is insufficient evidence to recommend the use of one intervention for clinical or subclinical hypothyroidism pre-pregnancy or during pregnancy over another, for improving maternal, fetal, neonatal & childhood outcomes.

Available at: http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/DrugSafetyInformationforHeathcareProfessionals/ucm162701.htm . Accessed February 9, 2010.

Given these potential adverse effects, the FDA issued an alert on June 4, 2009 that noted the risk of serious liver injury, including liver failure and death, with the use of PTU in adult (1:10,000) and pediatric (1:2,000) patients. These conferences focused on the relative safety of methimazole compared with PTU.[11-14,16] Approximately 30% of patients treated with PTU will have 1- to 2-fold elevations of serum aminotransferase levels. The liver disease associated with PTU can be severe. In the Adverse Event Reporting System (AERS), approximately 22 adult (12 deaths, 5 hepatic transplants) and 10 pediatric (1 death, 6 hepatic transplants) cases of serious hepatic injury associated with PTU treatment were reported. Methimazole, by contrast, was associated with 5 adult cases of serious hepatic injury with 3 deaths. In a system that may overlap with AERS, the United Network for Organ Sharing reported 23 hepatic transplants from 1990 to 2007 (16 adult, 7 children) related to PTU-associated hepatic failure.[11-13,16] Concurrently, no liver transplants related to the use of methimazole were reported. The average PTU dose in children and adults requiring liver transplant was 300 mg daily. Liver failure occurred between 6 and 450 days after starting treatment (median 120 days). Furthermore, there were 2 reports of serious maternal liver disease during pregnancy and 2 reports of liver injury in fetuses of mothers who ingested PTU during pregnancy.[11-14,16]

RxFiles provides objective, comparative, evidence informed drug information for drug therapy decision making. One hallmark of the program is the academic detailing service or "office visit discussions" provided for physicians/others in Saskatchewan, Canada. A second hallmark that has evolved is the RxFiles Drug Therapy Charts book. For more information on our academic detailing, book, app or online info & services, see our website at www.RxFiles.ca.

Book Orderform: http://www.rxfiles.ca/rxfiles/uploads/documents/1A-CHT-Book-ORDERFORM.pdf
Online store: http://www.rxfiles.ca/rxfiles/modules/products/products.aspx

RxFiles is funded for academic detailing in SK by Saskatchewan Health. Production and updating of our drug comparison charts book is provided via additional revenue from the sale of books and online subscriptions. We are a not-for-profit information program. RxFiles does not receive any funding from the pharmaceutical industry.

Additional:

FDA Jan/14 is warning that the over-the-counter constipation drug sodium phosphate (marketed as Fleet, and generics) has been tied to heart and kidney damage and even death when patients exceed the recommended dose. The agency has identified over 50 serious adverse events related to dehydration and electrolyte disturbances (sodium, calcium, and phosphate) with both the oral and rectal formulations. Most cases occurred in older adults and children younger than 5 years.

Cochrane reviews CD:

- TNF-a for induction: data not combined. One RCT indicates single infusion may induce remission. CDP571 may induce remission; no evidence for etanercept. Need longer f/u to assess SE such as TB & lymphoma.
- MTX for induction: data not combined. Evidence from a single large trial suggests benefit of MTX 25 mg IM weekly for induction of remission & complete withdrawal from steroids in refractory disease. No evidence supports lower dose PO MTX.
- CsA for induction: low dose PO CsA does not induce remission. Higher PO or IV doses not adequately evaluated, but ↑risk SE such as nephrotoxicity. One study found clinical improvement on unvalidated scale, but remission not assessed.
- AZA and 6-MP effective for inducing remission (NNT=5); OR increases after 17 weeks of tx; NNT=3 for steroid sparing effect; NNT for SE=14.
- Budesonide: superior to placebo for induction & superior to mesalamine; budesonide was inferior to prednisone/prednisolone, but fewer SE. Note: in disease limited to ileum or ascending colon.
- Natalizumab: superior to placebo for induction, but trials halted after 2 cases fatal progressive multifocal leukoencephalopathy in MS.
- Corticosteroids superior to enteral nutrition therapy for induction.
- 5-ASA not superior to placebo in maintaining remission in CD.
- PO budesonide 6 mg/day not effective in maintaining remission.
- Anti-tubercular tx for maintaining remission: may be effective when remission induced by corticosteroids combined with anti-TB tx; however, this is based on subgroup analyses of 2 trials with small numbers
- Corticosteroids (maintenance): not effective and increased AE.
- Probiotics (maintenance): Lactobacilli GC, E. coli strain Nissle 1917, VSL#3, Saccharomyces boulardii-all not effective, but may be due to small sample size
- AZA (maintenance): effective NNT=7 for maintenance; NNT=3 for steroid sparing; NNH=19.

Cochrane reviews UC:

- 5-ASA superior to placebo to induce remission in UC & trended towards benefit over sulfasalazine (SSZ). However, cost an issue, therefore SSZ generally preferred. 5-ASA has fewer SE than SSZ. 5-ASA not associated with male infertility, but SSZ is.
- 5-ASA superior to placebo in maintaining remission for UC (NNT=6). 5-ASA NOT superior to SSZ (NNT= -19), indicating SSZ superior. HOWEVER, many trials required tolerance of SSZ as part of inclusion criteria (Bergman 2006)
- Transdermal nicotine superior to placebo for inducing remission in UC, however no benefit was seen when compared to standard therapy (oral prednisone or mesalamine). More patients on transdermal nicotine withdrew due to AE then placebo or standard therapy.
- Only 2 small trials identified for CsA; could not be pooled as major differences in design & patients involved. Quick response rates in severe disease appear beneficial, but long-term effects unknown.
- In moderate-severe, refractory disease, infliximab induces remission. NNT=5 at 8 weeks (based on ACT studies alone)
- Systematic review: Combination topical & oral 5ASA superior to oral 5ASA for induction of remission of mild-mod UC. Intermittent topical 5ASA superior to oral for prevention of relapse of quiescent UC.[Ford et al.]

88. Strate LL, Liu YL, Syngal S, et al. **Nut, corn, and popcorn consumption** and the incidence of diverticular disease. JAMA. 2008 Aug 27;300(8):907-14. In this large, prospective study of men without known diverticular disease, nut, corn, and popcorn consumption did not increase the risk of diverticulosis or diverticular complications. The recommendation to avoid these foods to prevent diverticular complications should be reconsidered.
89. Kitazaki S, Mitsuyama K, Masuda J, et al. Clinical trial: comparison of **alendronate** & alfacalcidol in glucocorticoid-associated osteoporosis in patients with ulcerative colitis. Aliment Pharmacol Ther. 2008 Nov 25. [Epub ahead of print] Our study indicates that alendronate is a safe, well tolerated, and more effective therapy than alfacalcidol for preventing glucocorticoid-associated bone loss in patients with ulcerative colitis.
90. **Infliximab** for the treatment of acute exacerbations of ulcerative colitis **NICE** Guidance Dec 2008 http://www.nice.org.uk/TA163
91. Kane S, Ford J, Cohen R, Wagner C. **Absence of Infliximab** in Infant Sera and **Breast Milk** From Nursing Mothers Receiving Therapy for Crohn's Disease Before and After Delivery. J Clin Gastroenterol. 2009 Jan 12. [Epub ahead of print]n=3. Infliximab was detected in the mothers' sera, but not in the breast milk of nursing mothers or in the sera of the breast-fed newborns. Data from this small series of patients suggest that infliximab was not transferred from mother to child, either in utero or through breast milk. These data suggest that mothers receiving infliximab should not be discouraged from nursing their children.
92. Turner D, Zlotkin SH, Shah PS, Griffiths AM. **Omega 3 fatty acids** (fish oil) for maintenance of remission in Crohn's disease. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD006320. Omega 3 fatty acids are safe but probably ineffective for maintenance of remission in CD. The existing data do not support routine maintenance treatment of Crohn's disease with omega 3 fatty acids.
93. Prefontaine E, Sutherland LR, Macdonald JK, Cepoiu M. **Azathioprine** or 6-mercaptopurine for maintenance of remission in Crohn's disease. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD000067. Azathioprine and 6-mercaptopurine are more effective than placebo for maintenance of remission in Crohn's disease. Higher response rates were obtained with azathioprine than 6-mercaptopurine. However, the one study evaluating 6-mercaptopurine used a relatively low dose of the drug. Future studies should look at the effect of higher doses of 6-mercaptopurine. There is weak evidence for a steroid sparing effect with azathioprine treatment.
94. Benchimol EI, Seow CH, Otley AR, Steinhart AH. **Budesonide** for maintenance of remission in Crohn's disease. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD002913. Budesonide is not more effective than placebo or weaning prednisolone for maintenance of remission in Crohn's disease. Some modest benefits are noted in patients receiving budesonide compared with placebo in terms of lower CDAI scores and longer time to relapse of disease. However, these benefits are offset by higher treatment-related adverse event rates and more frequent adrenocorticoid suppression in patients receiving budesonide. Therefore, budesonide is **not recommended** for maintenance of remission in Crohn's disease.

[Epub ahead of print] This is the first pediatric, n=29, randomized, placebo-controlled trial that suggests the efficacy and safety of a highly concentrated mixture of **probiotic bacterial strains (VSL#3**) in active UC and demonstrates its role in maintenance of remission.
97. Levine A, Kori M, Dinari G, Broide E, Shaoul R, Yerushalmi B, On A, Bujanover Y, Pröls M, Greinwald R; Israeli Pediatric Budesonide Study Group. Comparison of two dosing methods for induction of response and remission with **oral budesonide** in active pediatric Crohn's disease: A randomized placebo-controlled trial. Inflamm Bowel Dis. 2009 Feb 19. [Epub ahead of print] Group 1: Standard dose budesonide (9 mg/day) for 7 weeks followed by 6 mg budesonide daily for an additional 3 weeks. Group 2: Induction with 12 mg/day for the first month followed by the same regimen as Group 1. Use of an induction dose of budesonide followed by a budesonide taper resulted in a trend to higher rates of clinical remission and a decrease in inflammation, without an increase in steroid-associated side effects. Budesonide

158. Singh JA, Wells GA, Christensen R, et al. **Adverse effects of biologics**: a network meta-analysis and Cochrane overview. Cochrane Database of Systematic Reviews 2011, Issue 2. Art. No.: CD008794. DOI: 10.1002/14651858.CD008794.pub2. Overall, in the short term biologics were associated with significantly higher rates of total adverse events, withdrawals due to adverse events and TB reactivation. Some biologics had a statistically higher association with certain adverse outcomes compared to control, but there was no consistency across the outcomes so caution is needed in interpreting these results.

Health Technol Assess. 2013 Nov;17(55):1-212. Faecal calprotectin can be a highly sensitive way of detecting IBD, although there are inevitably trade-offs between sensitivity and specificity, with some false positives (IBS with positive calprotectin) if a low calprotectin cut-off is used. In most cases, a negative calprotectin rules out IBD, thereby sparing most people with IBS from having to have invasive investigations, such as colonoscopy.

RxFiles - Acid Suppression - Comparison Chart Supplement

EXTRAs

Sample NG Tube admin instructions for giving a MUPS formulation of a PPI: administering via feeding tube is as follows: "Pre-flush tube with 20 mL SW. Prepare & give immediately: put tab in catheter tip syringe. Draw up 25 mL SW for 14 French tubes or 50 mL SW for 8-13 French. Shake to disperse tab. Hold syringe tip up & check tip for clogging. Attach syringe keeping tip up. Point tip down & give 5-10 mLs. Remove, shake again & give remaining susp. Refill syringe with 25 mL SW, shake to suspend any remaining sediment & give. Post-flush with 40 mL SW for ND, NJ, PGJ and PG tubes and 20-30 mL for all other tube types."

[18] Chan FK, Hung LC, Suen BY, et al. Celecoxib versus diclofenac and omeprazole in reducing the risk of recurrent ulcer bleeding in patients with arthritis. N Engl J Med. 2002 Dec 26;347(26):2104-10. Among patients with a recent history of ulcer bleeding, treatment with celecoxib was as effective as treatment with diclofenac plus omeprazole, with respect to the prevention of recurrent bleeding.
(Agrawal NM, Campbell DR, Safdi MA, et al. Superiority of **lansoprazole vs ranitidine in healing** nonsteroidal anti-inflammatory drug-associated gastric ulcers: results of a double-blind, randomized, multicenter study. NSAID-Associated Gastric Ulcer Study Group. Arch Intern Med. 2000 May 22;160(10):1455-61. In patients who require continuous treatment with NSAIDs, lansoprazole is superior to ranitidine for healing of NSAID-associated gastric ulcers. Healing is not delayed by the presence of H pylori infection.)(Yeomans ND, Tulassay Z, et al. A comparison of omeprazole with ranitidine for ulcers associated with nonsteroidal antiinflammatory drugs. Acid Suppression Trial: Ranitidine versus Omeprazole for NSAID-associated Ulcer Treatment (ASTRONAUT) Study Group. N Engl J Med. 1998 Mar 12;338(11):719-26. In patients with regular use of NSAIDs, omeprazole healed & prevented ulcers more effectively than did ranitidine.)
(Goldstein JL, Johanson JF, et al. Healing of gastric ulcers with **esomeprazole versus ranitidine** in patients who continued to receive NSAID therapy: a randomized trial. Am J Gastroenterol. 2005 Dec;100(12):2650-7.)
(Hawkey CJ, et al. Omeprazole compared with misoprostol for ulcers associated with nonsteroidal antiinflammatory drugs. Omeprazole versus Misoprostol for NSAID-induced Ulcer Management (OMNIUM) Study Group. N Engl J Med. 1998 Mar 12;338(11):727-34. The overall rates of successful treatment of ulcers, erosions, and symptoms associated with NSAIDs were similar for the two doses of omeprazole and misoprostol. Maintenance therapy with omeprazole was associated with a lower rate of relapse than misoprostol. Omeprazole was better tolerated than misoprostol.) (Chan FK, Wong VW, Suen BY, et al. Combination of a cyclo-oxygenase-2 inhibitor (celecoxib 200mg bid) and a proton-pump inhibitor (esomeprazole 20mg bid) for prevention of recurrent ulcer bleeding in patients at very high risk: a double-blind, randomised trial. Lancet. 2007 May 12;369(9573):1621-6. The 13-month cumulative incidence of the primary endpoint was 0% in the combined-treatment group and 12 (8.9%) in the controls (95% CI difference, 4.1 to 13.7; p=0.0004). n=441 12months. Patients at very high risk for recurrent ulcer bleeding who need anti-inflammatory analgesics should receive combination treatment with a COX 2 inhibitor and a PPI. Our findings should encourage guideline committees to review their recommendations for patients at very high risk of recurrent ulcer bleeding.

[19] Chan FK, Hung LC, Suen BY, Wong et al. Celecoxib versus diclofenac plus omeprazole in high-risk arthritis patients: results of a randomized double-blind trial. Gastroenterology. 2004 Oct;127(4):1038-43. Among patients with previous ulcer bleeding, neither celecoxib nor diclofenac plus omeprazole adequately prevents ulcer recurrence. Treatment-induced significant dyspepsia is an indication for endoscopic evaluation..

Chan FK, et al. Preventing recurrent upper gastrointestinal bleeding in patients with Helicobacter pylori infection who are taking low-dose aspirin or naproxen. N Engl J Med. 2001 Mar 29;344(13):967-73. CONCLUSIONS: Among patients with H. pylori infection and a history of upper gastrointestinal bleeding who are taking low-dose aspirin, the eradication of H. pylori is equivalent to treatment with omeprazole in preventing recurrent bleeding. Omeprazole is superior to the eradication of H. pylori in preventing recurrent bleeding in patients who are taking other NSAIDs.

Chan Walter W.; Chiou Eric; Obstein Keith L.; et al. The Efficacy of Proton Pump Inhibitors for the **Treatment of Asthma** in Adults: A Meta-analysis. *Arch Intern Med*. 2011;171(7):620-629.

Chang AB, et al. Systematic review and meta-analysis of randomised controlled trials of gastro-oesophageal reflux interventions for **chronic cough** associated with gastro-oesophageal reflux. BMJ. 2005 Dec 5; [Epub] CONCLUSION: Use of a proton pump inhibitor to treat cough associated with GORD has some effect in some adults. The effect, however, is less universal than suggested in consensus guidelines on chronic cough and its magnitude of effect is uncertain. (InfoPOEMs: Treatment for gastroesophageal reflux disease (GERD) in patients with chronic cough may be effective in some patients, but the effect is not universal or consistent. It might be worth a try, but don't expect many patients to improve. (LOE = 1a))

Chang AB, Lasserson TJ, Gaffney J, et al. Gastro-oesophageal reflux treatment for prolonged **non-specific cough** in children and adults. Cochrane Database Syst Rev. 2011 Jan 19;1:CD004823. PPI is not efficacious for cough associated with GORD symptoms in very young children (including infants) and should not be used for cough outcomes. There is insufficient data in older children to draw any valid conclusions. In adults, there is insufficient evidence to conclude definitely that GORD treatment with PPI is universally beneficial for cough associated with GORD.

Gee DW, Andreoli MT, Rattner DW. Measuring the effectiveness of **laparoscopic antireflux surgery**: long-term results. Arch Surg. 2008 May;143(5):482-7. Contrary to the medical literature, our results demonstrate that patients undergoing primary LF by an experienced surgical team have near-normal GERD-HRQL scores at long-term follow-up and low reoperation rates and are satisfied with their decision to undergo surgery. Results following redo LF are not as good, highlighting the importance of proper patient selection and surgical technique when performing primary LF.

Health Canada **Aug/07** is advising consumers that it is currently reviewing new preliminary safety information regarding **serious cardiac events** in patients using Losec (omeprazole) and Nexium (esomeprazole), two prescription drugs used to treat acid-related stomach disorders. (**Feb 27, 2008** Health Canada Completes Safety Review of Losec (omeprazole) and Nexium (esomeprazole) OTTAWA - Further to its Information Update dated August 9, 2007, Health Canada is informing Canadians of the results of its review of safety information for Losec (omeprazole) and Nexium (esomeprazole), two prescription drugs used to treat conditions where a reduction of gastric acid secretion is required, such as ulcers and reflux. In Canada, omeprazole is also sold in generic form as Apo-omeprazole, Ratio-omeprazole and Sandoz-omeprazole. Esomeprazole is only sold under the trade name Nexium. Nexium (esomeprazole) Based on its review of the data available at this time, Health Canada has concluded that there is no evidence supporting an increased cardiovascular risk associated with the long-term use of esomeprazole. The Department will continue to monitor safety issues related to esomeprazole by conducting further analysis of ongoing long-term studies as this data becomes available. Losec (omeprazole) After a thorough analysis, based on the data available to us at this time, we are unable to definitively conclude if there is a potential for increased cardiovascular risk associated with the long-term use of omeprazole. We will continue to evaluate should more conclusive data become available, and will advise Canadians if any further regulatory actions are required.)

Holtmann G, et al. A placebo-controlled trial of **itopride** in functional dyspepsia. N Engl J Med. 2006 Feb 23;354(8):832-40. (InfoPOEMs: Itopride was somewhat effective for functional dyspepsia, with a number needed to treat of 6 for global improvement but only a small 2-point benefit on a 40-point symptom scale (essentially, an improvement from 12 to 8 with placebo and from 12 to 6 with itopride). The drug appears to be safe on the basis of this small, short study. (LOE = 1b))

Hooper L, Brown TJ, Elliott R, et al. The effectiveness of five strategies for the prevention of gastrointestinal toxicity induced by non-steroidal anti-inflammatory drugs: systematic review. BMJ. 2004 Oct 23;329(7472):948. Epub 2004 Oct 8. CONCLUSIONS: Misoprostol, COX-2 specific and selective NSAIDs, and probably proton pump inhibitors significantly reduce the risk of symptomatic ulcers, and misoprostol and probably COX-2 specifics significantly reduce the risk of serious gastrointestinal complications, but data quality is low. More data on H2 receptor antagonists and proton pump inhibitors are needed, as is better reporting of rare but important outcomes.

Kaltenbach T, Crockett S, Gerson LB. Are **lifestyle** measures effective in patients with gastroesophageal reflux disease? An evidence-based approach. Arch Intern Med. 2006 May 8;166(9):965-71. Neither tobacco nor alcohol cessation was associated with improvement in esophageal pH profiles or symptoms (evidence B). Head of bed elevation and left lateral decubitus position improved the overall time that the esophageal pH was less than 4.0 (evidence B). Weight loss improved pH profiles and symptoms (evidence B). Weight loss and head of bed elevation are effective lifestyle interventions for GERD. There is no evidence supporting an improvement in GERD measures after cessation of tobacco, alcohol, or other dietary interventions. (InfoPOEMs: Decreasing gastroesophageal reflux disease (GERD) symptoms with lifestyle changes requires an empirical approach; the research literature gives very little guidance regarding nondrug approaches. Neither smoking cessation, alcohol avoidance, nor any food avoidances have been shown to make, on average, a difference in symptoms, although existing studies are small and of poor quality. Elevating the head of the bed may be effective. Weight loss may also be effective. Of course, if patients find something that works, encourage them to continue doing it. (LOE = 3a-))

Lai KC, Chu KM, Hui WM, et al. Celecoxib compared with lansoprazole and naproxen to prevent gastrointestinal ulcer complications. Am J Med. 2005 Nov;118(11):1271-8. CONCLUSIONS: Celecoxib was as effective as lansoprazole co-therapy in the prevention of recurrences of ulcer complications in subjects with a history of NSAID-related complicated peptic ulcers. However, celecoxib, similar to lansoprazole co-therapy, was still associated with a significant proportion of ulcer complication recurrences. In addition, more patients receiving celecoxib developed dyspepsia than patients receiving lansoprazole and naproxen.

Laine L, Shah A, Bemanian S. Intragastric pH With **Oral vs Intravenous** Bolus Plus Infusion Proton Pump Inhibitor Therapy in Patients With Bleeding Ulcers. Gastroenterology. 2008 Mar 10. [Epub ahead of print] Frequent oral PPI may be able to replace the currently recommended intravenous bolus plus infusion PPI {intravenous lansoprazole (90-mg bolus followed by 9-mg/h infusion) or oral lansoprazole (120-mg bolus followed by 30 mg every 3 hours)}therapy in patients with bleeding ulcers, although the possibility that intravenous PPIs are superior cannot be definitively excluded given our relatively wide confidence intervals. Intravenous PPI provides more rapid increase in pH, reaching mean pH of 6 approximately 1 hour sooner than oral PPI.

Sanabria A, Morales C, Villegas M. **Laparoscopic repair** for perforated peptic ulcer disease. Cochrane Database Syst Rev. 2005 Oct 19;4:CD004778. This systematic review suggests that a decrease in septic abdominal complications may exist when laparoscopic surgery is used to correct perforated peptic ulcer. However, it is necessary to develop more randomised controlled trials that include a greater number of patients to confirm such an assumption, guaranteeing a long learning curve for participating surgeons. With the information provided by the available clinical trials it could be said that laparoscopic surgery results are not clinically different from those of open surgery.

(Talley NJ; American Gastroenterological Association. AGA medical position statement: evaluation of dyspepsia. Gastroenterology. 2005 Nov;129(5):1753-5.) Talley NJ, Vakil N; Practice Parameters Committee of the American College of Gastroenterology. Guidelines for the management of dyspepsia. Am J Gastroenterol. 2005 Oct;100(10):2324-37. (InfoPOEMs: Patients with dyspepsia may have gastroesophageal reflux disease (GERD), peptic ulcer, functional (nonulcer) dyspepsia, or (rarely) malignancy. The authors reviewed the world's literature and based their recommendations on the results of the best available evidence. Patients with the onset of dyspepsia at age 56 or older or those with alarm symptoms (bleeding, anemia, early satiety, unexplained weight loss, dysphagia or odynophagia, persistent vomiting, family history of gastrointestinal malignancy, previous documented peptic ulcer, abdominal mass, or lymphadenopathy) at any age should undergo immediate upper endoscopy. Patients with reflux predominant symptoms should be treated as if they have GERD. If the prevalence of Helicobacter pylori (HP) infection in your community is less than 10%, a trial of a proton pump inhibitor (PPI) is recommended. If that fails, a test for HP infection followed by eradication if positive should be pursued. When HP is more common, the test-and-treat strategy should be pursued first, followed by a trial of a PPI. If these strategies fail, upper endoscopy should be considered according to the clinician's judgment. However, the prevalence of ulcer or malignancy in HP- negative patients is quite low in this group.)

Wang WH, Huang JQ, Zheng GF, et al. Is proton pump inhibitor testing an effective approach to diagnose gastroesophageal reflux disease in patients with noncardiac chest pain?: a meta-analysis. Arch Intern Med. 2005 Jun 13;165(11):1222-8. CONCLUSION: The use of PPI treatment as a diagnostic test for detecting GERD in patients with NCCP has an acceptable sensitivity and specificity and could be used as an initial approach by primary care physicians to detect GERD in selected patients with NCCP. (InfoPOEMs: In patients with chest pain known NOT to be cardiac in origin, response to treatment with an stomach-acid reducing proton pump inhibitor will identify most patients with gastroesophageal reflux (GERD) and can be the first step in explaining the chest pain. (LOE = 1b))

Wang J, Yang K, Ma B, et al. Intravenous pantoprazole as an adjuvant therapy following successful **endoscopic** treatment for peptic ulcer bleeding. Can J Gastroenterol. 2009 Apr [cited 2010 May 19];23(4):287-99.

Wang Chih-Hung; Ma Matthew Huei-Ming; Chou Hao-Chang; et al. **High-Dose vs Non-High-Dose Proton Pump Inhibitors** After Endoscopic Treatment in Patients With Bleeding Peptic Ulcer: A Systematic Review and Meta-analysis of Randomized Controlled Trials. Arch Intern Med. 2010;170(9):751-758. Compared with non–high-dose PPIs, highdose PPIs do not further reduce the rates of rebleeding, surgical intervention, or mortality after endoscopic treatment in patients with bleeding peptic ulcer.

Wildschut H, Both MI, Medema S, et al. **Medical methods for mid-trimester termination of pregnancy**. Cochrane Database Syst Rev. 2011 Jan 19;1:CD005216. (mifepristone and misoprostol)

Zacny J, Zamakhshary M, Sketris I, et al. Systematic review: the efficacy of intermittent and on-demand therapy with histamine H2-receptor antagonists or proton pump inhibitors for gastro-oesophageal reflux disease patients. Aliment Pharmacol Ther. 2005 Jun 1;21(11):1299-312. CONCLUSIONS: Intermittent proton pump inhibitor or H2-receptor antagonist therapy is not effective in maintaining control in oesophagitis patients. H2-receptor antagonists are effective for relief of heartburn episodes. On-demand proton pump inhibitor therapy may work in a proportion of non-erosive gastro-oesophageal reflux disease patients excluded. The benefit did not persist through the next 5 months when patients could use medications as needed rather than in a scheduled manner. Ranitidine was more cost-effective than omeprazole. It still makes sense to try ranitidine first for these patients, then stepping up to omeprazole if their symptoms are not improved adequately, particularly since this is a benign, self-limited condition. Vaira D, et al. **Sequential** therapy versus standard triple-drug therapy for Helicobacter pylori eradication: a randomized trial. Ann Intern Med. 2007 Apr 17;146(8):556-63. n=300

Sequential therapy is statistically significant compared with standard therapy for eradicating H. pylori infection and is statistically significantly more effective in patients with clarithromycin-resistant strains. Side effects are similar with both treatment regimens and are rarely severe enough to cause discontinuation of therapy.

Valle PC, et al. "Test, score and scope": a selection strategy for safe reduction of upper gastrointestinal endoscopies in young dyspeptic patients referred from primary care. (InfoPOEMs: For men younger than 45 years, the endoscopic yield is very low for those without Helicobacter pylori infection, nonsteroidal anti-inflammatory drug (NSAID) use, unintended weight loss, or anemia. (LOE = 2b))

Veldhuyzen van Zanten SJ, Chiba N, Armstrong D, Barkun A, Thomson A, et al. A randomized trial comparing omeprazole, ranitidine, cisapride, or placebo in helicobacter pylori negative, primary care patients with dyspepsia: the CADET-HN Study. Am J Gastroenterol. 2005 Jul;100(7):1477-88. Treatment with omeprazole provides superior symptom relief compared to ranitidine, cisapride, and placebo in the treatment of H. pylori negative primary care dyspepsia patients.

Vergara M, Vallve M, Gisbert JP, Calvet X. Meta-analysis: comparative efficacy of different proton-pump inhibitors in triple therapy for Helicobacter pylori eradication. Aliment Pharmacol Ther. 2003 Sep 15;18(6):647-54. The efficacy of various proton-pump inhibitors seems to be similar when used for H. pylori eradication in standard triple therapy.

Vergara M, Catalán M, Gisbert JP, Calvet X. Meta-analysis: role of Helicobacter **pylori eradication in the prevention of peptic ulcer in NSAID** users. Aliment Pharmacol Ther. 2005 Jun 15;21(12):1411-8.

Wündisch T, Dieckhoff P, Greene B, et al. Second Cancers and Residual Disease in Patients Treated for Gastric Mucosa-Associated Lymphoid Tissue Lymphoma by Helicobacter pylori Eradication and Followed for 10 Years. Gastroenterology. 2012 Oct;143(4):936-42.

Zapata-Colindres JC,et al. The association of **Helicobacter pylori infection and nonsteroidal anti-inflammatory drugs** in peptic ulcer disease. Can J Gastroenterol. 2006 Apr;20(4):277-80. The development of PUD was observed earlier in the combined H pylori and NSAID group than in patients with only NSAID use. This suggests a synergic effect between the two risks factors in the development of PUD.

Zagari RM, et al. Comparison of **one and two weeks** of omeprazole, amoxicillin and clarithromycin treatment for Helicobacter pylori eradication: the HYPER study. Gut. 2006 Oct 6; [Epub ahead of print] n=909 One-week and two-week PPI-based triple therapies (omeprazole, amoxicillin and clarithromycin) for H. pylori eradication are similar in terms of efficacy, safety and patient compliance.

Zagari RM, Bianchi-Porro G, et al. Comparison of 1 and 2 weeks of omeprazole, amoxicillin and clarithromycin treatment for Helicobacter pylori eradication: the HYPER Study. Gut. 2007 Apr;56(4):475-9. Epub 2006 Oct 6. n=909. CONCLUSIONS: 1-week and 2-week triple treatments for H pylori eradication are similar in terms of efficacy, safety and patient compliance. (InfoPOEMs: One week of omeprazole, amoxicillin, and clarithromyin given twice daily is as effective at eradicating Helicobacter pylori (HP) as 2 weeks of treatment. It also costs less and is less burdensome for patients. (LOE = 1b))

Zojaji H, Talaie R, Mirsattari D, et al. The efficacy of Helicobacter pylori eradication regimen with and without **vitamin C** supplementation. Dig Liver Dis. 2009 Jun 1. [Epub ahead of print] Addition of vitamin C to H. pylori treatment regimen of amoxicillin, metronidazole and bismuth can significantly increases H. pylori eradication rate.

Zullo A, et al. High rate of H. pylori eradication with **sequential therapy** in elderly pts with peptic ulcer:a prospective controlled study.Aliment Pharmacol Ther.2005;21:1419-24.

Zullo A, Hassan C, Andriani A, et al.. Eradication Therapy for Helicobacter pylori in Patients With Gastric **MALT Lymphoma**: A Pooled Data Analysis. Am J Gastroenterol. 2009 Jun 16. [Epub ahead of print] This was the first comprehensive (approximately 1,300 patients) analysis of the therapeutic management of H. pylori in gastric lymphoma patients. Data suggest that this infection is easily managed in these patients, being cured in nearly all cases.

Extras:

Discontinued Drugs: Alosetron LOTRONEX (2000 -severe constipation & ischemic colitis) avail. in USA ♀ special access 5HT3 antagonist. Not avail. in Canada.

Tegaserod ZELNORM: Mar07- suspended due to CV ischemic events; but Apr08-FDA for Emergency IND situations only use in IBS-constipation & chronic idiopathic constipation in ♀<55yr with no hx of heart problems. 6 mg po bid $160 (NNT=14) 5HT4 agonist Not avail in Canada.

Acupuncture: no difference in IBS symptom severity or IBS-related quality of life when compared to shame-acupuncture.[81]

Patient Handout http://www.nice.org.uk/nicemedia/live/11927/40608/40608.pdf

Notes:

- Children with IBS or functional abdominal pain: probiotic Lactobacillus rhamnosus GG 3 billion colony forming units twice daily reduced # of pain episodes & pain intensity by ≥50% more in Tx vs Pl group (8wks; ave age 6).[53]
- A high-fibre diet and increased frequency of bowel movements may not protect against diverticulosis.[72]

30. Vahedi H, Merat S, Momtahen S, Kazzazi AS, et al. Clinical trial: the effect of amitriptyline in patients with diarrhoea-predominant irritable bowel syndrome. Aliment Pharmacol Ther. 2008;27:678-84.

31. Camilleri M, Kerstens R, Rykx A, Vandeplassche L. A placebo-controlled trial of prucalopride for severe chronic constipation. N Engl J Med. 2008 May 29;358(22):2344-54. n=620. Over 12 weeks, prucalopride 2-4mg po daily x 12 weeks significantly improved bowel function and reduced the severity of symptoms in patients with severe chronic constipation. Larger and longer trials are required to further assess the risks and benefits of the use of prucalopride for chronic constipation.

32. Ford AC, Talley NJ, et al. Effect of **fibre, antispasmodics, and peppermint oil** in the treatment of irritable bowel syndrome: systematic review and meta-analysis. BMJ. 2008 Nov 13;337:a2313. doi: 10.1136/bmj.a2313. Fibre, antispasmodics, & peppermint oil were all more effective than placebo in treatment of irritable bowel syndrome. Fibre provides minimal likelihood of benefit in patients with irritable bowel syndrome (IBS). Antispasmodics, particularly scopolamine (hyoscine) and otilonium, are effective in 50% to 70% of patients. Peppermint oil is also effective, with approximately 75% of patients responding (number needed to treat = 2.5). (LOE = 1a-)

33. Moayyedi P, Ford AC, Talley NJ, et al. The efficacy of **probiotics** in the therapy of irritable bowel syndrome: a systematic review. Gut. 2008 Dec 17. [Epub ahead of print]
Probiotics appear to be efficacious in IBS but the magnitude of benefit and the most effective species and strain are uncertain.

34. Nikfar S, Rahimi R, Rahimi F, Derakhshani S, Abdollahi M. Efficacy of **probiotics** in irritable bowel syndrome: a meta-analysis of randomized, controlled trials. Dis Colon Rectum. 2008 Dec;51(12):1775-80. Epub 2008 May 9. This systematic review/meta-analysis of randomized trials found a significant benefit of probiotics (number needed to treat [NNT] = 12) for improving symptoms of irritable bowel syndrome (IBS). Given the frequent difficulty in adequately treating this illness and the generally benign effects of probiotics, clinicians should strongly consider them for their patients with IBS. (LOE = 1a)b

61. Kaminski A, Kamper A, Thaler K, et al. **Antidepressants for the treatment of abdominal pain-related functional gastrointestinal disorders in children and adolescents**. Cochrane Database Syst Rev. 2011 Jul 6;7:CD008013. Clinicians must be aware that for the majority of antidepressant medications no evidence exists that supports their use for the treatment of abdominal pain-related FGIDs in children and adolescents. The existing randomised controlled evidence is limited to studies on amitriptyline and revealed no statistically significant differences between amitriptyline and placebo for most efficacy outcomes. Amitriptyline does not appear to provide any benefit for the treatment of FGIDs in children and adolescents.

Cochrane Database Syst Rev. 2011 Aug 10;(8):CD003460. There is no evidence that bulking agents are effective for treating IBS. There is evidence that antispasmodics are effective for the treatment of IBS. The individual subgroups which are effective include: cimetropium/dicyclomine, peppermint oil, pinaverium and trimebutine. There is good evidence that antidepressants are effective for the treatment of IBS. The subgroup analyses for SSRIs and TCAs are unequivocal and their effectiveness may depend on the individual patient.

Alhashimi D, Al-Hashimi H, Fedorowicz Z. Antiemetics for reducing vomiting related to acute gastroenteritis in children and adolescents. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD005506. The small number of included trials provided some limited evidence favouring the use of ondansetron and metoclopramide over placebo to reduce the number of episodes of vomiting due to gastroenteritis in children. The increased incidence of diarrhea with both ondansetron and metoclopramide was considered to be as a result of retention of fluids and toxins that would otherwise have been eliminated through the process of vomiting.

Fedorowicz Z, Jagannath VA, Carter B. Antiemetics for reducing vomiting related to acute gastroenteritis in children and adolescents. Cochrane Database of Systematic Reviews 2011, Issue 9. Art. No.: CD005506. DOI: 10.1002/14651858.CD005506.pub5. Oral ondansetron increased the proportion of patients who had ceased vomiting and reduced the number needing intravenous rehydration and immediate hospital admission. Intravenous ondansetron and metoclopramide reduced the number of episodes of vomiting and hospital admission, and dimenhydrinate as a suppository reduced the duration of vomiting.

FDA Warning regarding metoclopramide & tardive dyskinesia (Feb 2009): http://www.fda.gov/bbs/topics/NEWS/2009/NEW01963.html
FDA Sep/09 notified healthcare professionals that a Boxed Warning is being added to the prescribing information for **Promethazine** Hydrochloride products, describing the risks of severe tissue injury, including gangrene, requiring amputation following intravenous administration of promethazine.
FDA Dec/09 The Texas Department of State Health Services and FDA notified healthcare professionals and consumers, especially pregnant or breastfeeding women, to avoid consuming a product called "**Nzu**", taken as a traditional remedy for morning sickness,because of the potential health risks from high levels of lead and arsenic, noted on laboratory analysis by Texas DSHS. Nzu, which is sold at African specialty stores is also called Calabash clay, Calabar stone, Mabele, Argile and La Craie. It generally resembles balls of clay or mud and is usually sold in small plastic bags with a handwritten label identifying it as "Nzu" or "Salted Nzu."
FDA Dec/10 The injectable form of **dolasetron** mesylate (Anzemet) should not be used to prevent nausea or vomiting related to chemotherapy because the drug increases the risk for torsade de pointes. The FDA recommends against using Anzemet injections in patients with congenital long-QT syndrome. The warning does not apply to Anzemet tablets because the risks for developing an abnormal heart rhythm are not as high as with the injections. FDA MedWatch alert (Free)
FDA Sep/11 The U.S. Food and Drug Administration (FDA) is informing the public of an ongoing safety review of the anti-nausea drug Zofran (**ondansetron**, ondansetron hydrochloride and their generics). Ondansetron may increase the risk of developing abnormal changes(QT prolongation & torsades) in the electrical activity of the heart
FDA Dec/12 is working with the manufacturers of all **32 mg dose Ondansetron Injectable** Products (brand and generic) to voluntarily recall them from the market due to QT serious cardiac toxicity.
Fujii Y, Itakura M. Comparison of **propofol, droperidol**, and metoclopramide for prophylaxis of postoperative nausea and vomiting after breast cancer surgery: a prospective, randomized, double-blind, placebo-controlled study in Japanese patients. Clin Ther. 2008 Nov;30(11):2024-9.

Gouin S, Vo TT, Roy M, et al. Oral **Dimenhydrinate** Versus Placebo in Children With Gastroenteritis: A Randomized Controlled Trial. Pediatrics. 2012 May 14.
Health Canada May/11 ANZEMET (**dolasetron** mesylate) - Withdrawal of **20 mg/mL Intravenous** Injection Due to Potential Risk of Arrhythmias. New data suggest that intravenous administration of the injectable form of ANZEMET (dolasetron mesylate) may result in serious arrhythmias.
Health Canada July/11 is informing health professionals and consumers that the labelling information for the drug **metoclopramide** is being updated to include stronger warnings on the risk of a movement disorder known as "**tardive dyskinesia**."
Health Canada Mar/12: **Domperidone** should be used at the lowest possible dose. The risk of serious ventricular arrhythmias (QT) and sudden cardiac death may be higher in patients taking daily doses greater than 30 mg, and in patients over 60 years old.
Health Canada Oct/12: Ondansetron can cause a dose-dependent prolongation of the electrocardiographic-corrected QT interval (QTc), which can lead to Torsade de Pointes, a potentially life-threatening heart rhythm abnormality. The new maximum recommended single intravenous (IV) dose of ZOFRAN®is 16 mg infused over 15 minutes.
Health Canada May/14 has completed a safety review of the serotonin blocking drugs **dolasetron** (ANZEMET), **granisetron** (KYTRIL and generics), **ondansetron** (ZOFRAN and generics) and palonosetron (ALOXI), which are used for treating nausea and vomiting. This review identified a potential risk of **serotonin syndrome**.

MHRA Aug/12 The new maximum single intravenous dose of **ondansetron** for the management of chemotherapy-induced nausea and vomiting (CINV) in adults is now 16 mg (infused over at least 15 minutes). This restriction follows a review of new study data, which showed that there is a greater risk of prolongation of the electrocardiographic-corrected **QT** interval (QTc).

Cochrane Database of Systematic Reviews 2010, Issue 9. Art. No.: CD007786. DOI: 10.1002/14651858.CD007786.pub2. Our overall knowledge of themost effective antiemetics to prevent chemotherapy-induced nausea and vomiting in childhood is incomplete. This review suggests that 5-HT3 antagonists with dexamethasone added are effective in patients who are to receive highly emetogenic chemotherapy although the risk-benefit profile of additional steroid remains uncertain.

Melnik T, Soares B, Nasselo A. **Psychosocial interventions** for erectile dysfunction. Cochrane Database Syst Rev. 2007 Jul 18;(3):CD004825. There was evidence that group psychotherapy may improve erectile function. Treatment response varied between patient subgroups, but focused sex-group therapy showed greater efficacy than control group (no treatment). In a meta-analysis that compared group therapy plus sildenafil citrate versus sildenafil, men randomised to receive group therapy plus sildenafil showed significant improvement of successful intercourse, and were less likely than those receiving only sildenafil to drop out. Group psychotherapy also significantly improved ED compared to sildenafil citrate alone. Regarding the effectiveness of psychosocial interventions for the treatment of ED compared to local injection, vacuum devices and other psychosocial techniques, no differences were found.
MHRA Feb/12 has received advice from AGES PharmMed in Austria and the Danish Medicines Agency, warning that these unlicensed products have been tested and found to contain Tadalafil and/or Sildenafil:
AH Free/Reflexit, Stree Overlord, Man King, VigRX, Maxman, Maxman III, Viriya, & Imbiza for Men.
MHRA: Austrian Sep/12 authorities have issued a warning for **Ramlostan Forte** manufactured by SC Parapharm, Romania. Ramlostan comes in white and blue packaging, with a picture of a ram at the top. Inside, there are ten blue capsules. The Austrian authority (AGES) has issued a warning for this product after finding it to contain Tadalafil.
MHRA Nov/12 has received advice from the Ministry of Health, Jerusalem warning that this unlicensed product, **Shark Essence** has been tested and found to contain Tadalafil and Sildenafil.
MHRA May/14: Singapore Health Sciences Department **Li Long Mei Guo Mo Bang** because it contains sildenafil.

Recommendation 1: The American College of Physicians recommends that clinicians initiate therapy with a PDE-5 inhibitor in men who seek treatment for erectile dysfunction and who do not have a contraindication to PDE-5 inhibitor use (Grade: strong recommendation; high-quality evidence).
Recommendation 2: The American College of Physicians recommends that clinicians base the choice of a specific PDE-5 inhibitor on the individual preferences of men with erectile dysfunction, including ease of use, cost of medication, and adverse effects profile (Grade: weak recommendation; low-quality evidence).
Recommendation 3: The American College of Physicians does not recommend for or against routine use of hormonal blood tests or hormonal treatment in the management of patients with erectile dysfunction (Grade: insufficient evidence to determine net benefits and harms).

RxFiles Urinary Incontinence On-Line Extras:

Other Medications:

1) AChs, Other: **propantheline** - less effective & ↑ AE than flavoxate & oxybutynin.[11] NICE states not to use[1]; Adult: 7.5mg TID, 7.5-30mg 3-5x/day, 60mg QID; Geriatric: 7.5mg TID; Peds: 7.5-15mg q4-6h.
2) Adrenoreceptor agonists (**phenylpropanolamine** predominantly studied but use extended to **ephedrine**, **pseudoephedrine**): studied for SUI. But cardiac arrhythmias & HTN outweigh benefits.[31]
3) **Belladonna & opium suppositories:** used to relieve **pain of uretal spasms** & pain associated with bladder tenesmus that can occur post-op.[32] Some report use in nocturnal diuresis.[11]
Dicyclomine - insufficient data to recommend over other agents, dose 20-40mg QID.[11]
4) **Flavoxate**: Not used for OAB currently[1] but may be used in discomfort associated with BPH. Efficacy might be comparable to propantheline according to older, short-term studies.[11]
Dose: Adult: 100-200mg TID-QID. May reduce dose with sx improvement. One trial found 1200mg to be superior to 600mg/day. May be effective in children from 6-12 yrs experiencing nocturnal enuresis (33% vs 17% response in placebo).[11] Pediatrics > 12 yr: 100-200mg TID-QID. May reduce dose with sx improvement.[11]
5) **Phenazopyridine:**[11] used strictly as a **urinary analgesic**. The necessity of this medication would suggest pathology different from UI. Dose: Adult: 200mg TID after meals. If renal GFR > 50mL/min 200mg q8-16h. Avoid if GFR < 50mL/min. Geriatrics: ↑risk of accumulation & toxicity. AE: discolor urine
6) **Propiverine:**[53] tertiary amine with ACh & calcium channel antagonist activity; has active metabolites; dose: 15mg IR BID or 30mg ER daily; available United Kingdom.[2006]

Oxybutynin (OXY) vs Tolterodine (TOLT) in OAB

- OBJECT: OXY ER 10mg daily vs TOLT IR 2mg BID; 12 week; ♂ & ♀; Oxy ER slightly more effective (e.g. total incontinence episodes/wk: NNT=45); no difference in overall AEs (dry mouth, CNS effects).[52]
- OPERA: OXY ER 10mg vs TOLT ER 4mg daily; 12 week; ♀ only with severe symptoms; OXY ER somewhat more effective (e.g. 23 vs 16.8% no UI; NNT=16); but also more dry mouth (Any 29.7% vs 22.3%; NNH=13; mod-severe 7.4% vs 5.0%, NS).[50]
- ACET: OXY ER 5 or 10mg vs TOLT ER 2 or 4mg daily; 8 week; ♂ & ♀; TOLT 4mg more effective than OXY 10 70 vs 60% improvement; but lower doses efficacy still ~60% & less dry mouth but similar for TOLT 4mg vs OXY 5mg ; open label trial & subjective assessments subject to bias.[51]

2. Hashim H, Abrams P. How should patients with an overactive bladder manipulate their fluid intake? BJU Int. 2008 Feb 18; [Epub ahead of print] Fluid manipulation is a cheap, noninvasive and easy way to help control the symptoms of OAB. Patients have difficulty in either decreasing or increasing their fluid input by 50%. Patients can now be told to expect a significant improvement in urgency, frequency and nocturia episodes if they reduce their fluid input by 25%.

18. Kay G, Crook T, Rekeda L, Lima R, et al. Darifenacin has theoretical cognitive advantages. Some preliminary placebo controlled trials have results supporting this claim. At first glance this trial by Key et al. appears to support these advantages based on the *name-face association test*. However when trial design issues (e.g. high oxybutinin dose for elderly, early drop outs), discussion bias, adverse event rates and overall limitations are considered, this study does not prove a definite advantage for darifenacin over oxybutynin. Further study is needed (especially with a more rational dose comparator) in elderly with urinary incontinence and at high risk for cognitive impairment. Darifenacin may offer a relative advantage or disadvantage to other anticholinergics depending on dose used and individual patient response. Currently, darifenacin offers a cost advantage over some comparators. {Cost/month[SK]: Enablex 7.5-15mg/day= $59; Ditropan XL 5-10mg/day= $84,15-20mg/day=$159; Uromax10-15mg/day=$50-53; Detrol LA 2-4mg/day= $72.} See http://www.rxfiles.ca/acrobat/UI-Darifenacin-Kay-Trial-Q&A.pdf }

32. Cody JD, Richardson K, Moehrer B, et al. Oestrogen therapy for urinary incontinence in post-menopausal women. Cochrane Database Syst Rev. 2009 Oct 7;(4):CD001405. Local oestrogen treatment for incontinence may improve or cure it, but there was little evidence from the trials on the period after oestrogen treatment
33. had finished and none about long-term effects. However, systemic hormone replacement therapy, using conjugated equine oestrogen, may make incontinence worse. There were too few data to reliably address other aspects of oestrogen therapy, such as oestrogen type and dose, and no direct evidence on route of
34. administration. The risk of endometrial and breast cancer after long-term use suggests that oestrogen treatment should be for limited periods, especially in those women with an intact uterus.
35. Cody JD, Jacobs ML, Richardson K, et al. **Oestrogen therapy for urinary incontinence** in post-menopausal women. Cochrane Database Syst Rev. 2012 Oct 17;10:CD001405. doi: 10.1002/14651858.CD001405.pub3. Urinary incontinence may be improved with the use of local oestrogen treatment. However, there was little
36. evidence from the trials on the period after oestrogen treatment had finished and no information about the long-term effects of this therapy was given. Conversely, systemic hormone replacement therapy using conjugated equine oestrogen may worsen incontinence.

Chapple C, Sievert KD, MacDiarmid S, et al. OnabotulinumtoxinA 100 U significantly improves all idiopathic overactive bladder symptoms and quality of life in patients with overactive bladder and urinary incontinence: a randomised, double-blind, placebo-controlled trial. Eur Urol. 2013 Aug;64(2):249-56.
52. Naumann M, So Y, Argoff CE, Childers MK, Dykstra DD, Gronseth GS, Jabbari B, Kaufmann HC, Schurch B, Silberstein SD, Simpson DM; Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Assessment: Botulinum neurotoxin in the treatment of autonomic disorders and pain (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 May 6;70(19):1707-14. Botulinum neurotoxin (BoNT) should be offered as a treatment option for the treatment of axillary hyperhidrosis and detrusor overactivity (Level A), should be considered for palmar hyperhidrosis, drooling, and detrusor sphincter dyssynergia after spinal cord injury (Level B), and may be considered for gustatory sweating and low back pain (Level C). BoNT is probably ineffective in episodic migraine and chronic tension-type headache (Level B). There is presently no consistent or strong evidence to permit drawing conclusions on the efficacy of BoNT in chronic daily headache (mainly transformed migraine) (Level U). While clinicians' practice may suggest stronger recommendations in some of these indications, evidence-based conclusions are limited by the availability of data.

Use of 5alpha-Reductase Inhibitors for **Prostate Cancer Chemoprevention**: American Society of Clinical Oncology/American Urological Association 2008 Clinical Practice Guideline. J Urol. 2009 Feb 24. [Epub ahead of print] Asymptomatic men with a prostate-specific antigen (PSA) </=3.0 ng/mL who are regularly screened with PSA or are anticipating undergoing annual PSA screening for early detection of prostate cancer may benefit from a discussion of both the benefits of 5-ARIs for 7 years for the prevention of prostate cancer and the potential risks (including the possibility of high-grade prostate cancer). Men who are taking 5-ARIs for benign conditions such as lower urinary tract [obstructive] symptoms (LUTS) may benefit from a similar discussion, understanding that the improvement of LUTS relief should be weighed with the potential risks of high-grade prostate cancer from 5-ARIs (although the majority of the Panel members judged the latter risk to be unlikely). A reduction of approximately 50% in PSA by 12 months is expected in men taking a 5-ARI; however, because these changes in PSA may vary across men, and within individual men over time, the Panel cannot recommend a specific cut point to trigger a biopsy for men taking a 5-ARI. No specific cut point or change in PSA has been prospectively validated in men taking a 5-ARI. http://jco.ascopubs.org/cgi/reprint/27/9/1502

149. FDA June/11 notified that the Warnings and Precautions section of the labels for the 5-alpha reductase inhibitor (5-ARI) class of drugs has been revised to include new safety information about the **increased** risk of being diagnosed with a more serious form of prostate cancer **(high-grade prostate cancer)**. {PCPT & Reduce FDA reviewed data from two prostate cancer prevention trials. In one, finasteride (given daily for 7 years) was associated with a higher frequency of prostate cancers with Gleason scores between 8 and 10, compared with placebo (1.8% vs. 1.1%). In the other, dutasteride (given daily for 4 years) was also associated with more high-grade cancers relative to placebo (1% vs. 0.5%)}.

Our results suggest that "medical expulsive therapy," using either alpha-antagonists or calcium channel blockers, augments the stone expulsion rate compared to standard therapy for moderately sized distal ureteral stones. This meta-analysis of low-quality studies shows that ureteral stone passage can be enhanced by treating patients with an alpha-blocker such as tamsulosin (Flomax) or the calcium channel blocker nifedipine (Procardia). Better studies may refute these findings, but for now either approach is an option. (LOE = 1a-).

172. Thomas LH, et al. Treatment of urinary incontinence **after stroke** in adults. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD004462. Data from the available trials are insufficient to guide continence care of adults after stroke. However, there was suggestive evidence that professional input through structured assessment and management of care and specialist continence nursing may reduce urinary incontinence and related symptoms after stroke.
173. Cantrell MA, Bream-Rouwenhorst HR, Steffensmeier A, et al.Intraoperative Floppy Iris Syndrome Associated with {alpha}1-Adrenergic Receptor Antagonists (April). Ann Pharmacother. 2008 Mar 25; [Epub ahead of print] Other alpha1AR antagonists, including terazosin, doxazosin, and alfuzosin, have also been linked to IFIS; however, their relationship to the syndrome is not as definitive. **IFIS** is a clinical syndrome observed during cataract surgery reported in patients taking systemic alpha1AR antagonists. It has been most strongly linked to use of tamsulosin. Medication washout periods of up to 2 weeks and specific surgical procedures have been attempted to reduce risk of complications from alpha1AR antagonists in the setting of cataract surgery.
174. Wilt T, et al. **Five-alpha-reductase Inhibitors for prostate cancer prevention**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD007091. 5ARI reduce prostate cancer risk but may increase risk of high-grade disease in men who are undergoing regular screening for prostate cancer using prostate specific antigen & digital rectal examination. Effects are consistent across race, family history and age and possibly 5ARI but were limited to men with baseline PSA values <4.0 ng/mL.

239. Madhuvrata P, Cody JD, Ellis G, et al. Which **anticholinergic drug for overactive bladder symptoms in adults**. Cochrane Database Syst Rev. 2012 Jan 18;1:CD005429. Where the prescribing choice is between oral immediate release oxybutynin or tolterodine, tolterodine might be preferred for reduced risk of dry mouth. With tolterodine, 2 mg twice daily is the usual starting dose, but a 1 mg twice daily dose might be equally effective, with less risk of dry mouth. If extended release preparations of oxybutynin or tolterodine are available, these might be preferred to immediate release preparations because there is less risk of dry mouth. Between solifenacin and immediate release tolterodine, solifenacin might be preferred for better efficacy and less risk of dry mouth. Solifenacin 5 mg once daily is the usual starting dose, this could be increased to 10 mg once daily for better efficacy but with increased risk of dry mouth. Between fesoterodine and extended release tolterodine, fesoterodine might be preferred for superior efficacy but has higher risk of withdrawal due to adverse events and higher risk of dry mouth.There is little or no evidence available about quality of life, costs, or long-term outcome in these studies. There were insufficient data from trials of other anticholinergic drugs to draw any conclusions.
240. Burgio KL, Goode PS, Johnson TM, et al. **Behavioral versus drug treatment** for overactive bladder in **men**: the Male Overactive Bladder Treatment in Veterans (MOTIVE) Trial. J Am Geriatr Soc. 2011 Dec;59(12):2209-16.
241. Campbell SE, Glazener CM, Hunter KF, et al. Conservative management for **postprostatectomy urinary incontinence**. Cochrane Database Syst Rev. 2012 Jan 18;1:CD001843. The value of the various approaches to conservative management of postprostatectomy incontinence after radical prostatectomy remains uncertain. It seems unlikely that men benefit from one-to-one pelvic floor muscle training therapy after transurethral resection of the prostate (TURP). Long-term incontinence may be managed by external penile clamp, but there are safety problems.
242. Health Canada Mar/12 is informing health professionals and the public that the prescription drugs **finasteride and dutasteride** may be associated with an increased risk of developing a serious form of prostate cancer known as **high-grade prostate cancer**.
243. FDA: Apr/12 The labels of the alopecia drug Propecia (**finasteride** 1 mg) and the benign prostatic hyperplasia drug Proscar (finasteride 5 mg) are being updated with an expanded list of adverse **sexual effects**, the FDA has announced. Propecia label will include libido, ejaculation, and orgasm disorders that persist after treatment ends; Proscar label will include decreased libido that persists posttreatment & both labels will note reports of male infertility or poor semen quality that improved after drug discontinuation.

1) Breaking the "cold chain"

Canadian Guidelines: Refrigerated vaccines should be stored between +2°C and +8°C. Frozen vaccines should be stored at -15°C or colder. Store light sensitive vaccines away from light. Follow manufacturer recommendations for storage & transport. Administration requires someone trained to give im/sc injections.

Fridges:

-Fridge used should be dedicated to the storage of vaccines only.

-**Use of bar fridges for vaccine storage is the leading cause of cold chain breaks in Canada. Bar fridges are not recommended for the purpose of storing vaccines.**

- Keeping temperature of fridge stable **(2-8° C)**: Avoid opening refrigerator door unnecessarily, store containers of water in refrigerators, or ice packs in the freezer

NEVER store vaccines in the vegetable bin section of the refrigerator. Ideal storage location for vaccine: In the middle compartment, away from floor, coils, walls, and venting for the freezer or cold air.

-Temperature of the compartments of the refrigerator where the vaccine is stored should be checked and logged at least twice a day. Fridge temperatures outside of the 2 to 8 degree C range must be reported immediately to obtain recommendation on the stability of the affected product.

- Fridge temperature recording logs should be retained for 2 years.

- Min-Max thermometer batteries should be routinely changed twice a year: December 1 and June 1 and the date of changing noted on the device.

Transporting Refrigerated Vaccines: Avoid breaking the cold chain

1) Transport vaccines in insulated containers at all times. Hard sided plastic insulated containers, or Styrofoam containers with walls at least 2 inch thick walls should be used. Icepacks should be placed inside the transport container to maintain the cold chain. To prevent freezing the vaccine should never be placed directly onto an ice pack. Instead an insulating barrier (i.e. bubble wrap, Styrofoam peanuts) should be placed between vaccine and ice pack.
2) Make sure vaccine is never placed in trunk of vehicle, or in direct contact with sunlight. Also the vaccine should not be placed in line with the air from the vehicles heater or air conditioner. Vaccine should never be left in a vehicle unattended.
3) If a break in the cold chain identified prior to administration of the vaccine, contact your local public health authority about the appropriate course of action. While waiting for a decision, ensure that the vaccine is stored in appropriate cold chain conditions. The vaccine should not be administered until a decision has been reached.
4) If a break in the cold chain is identified after administration of the vaccine, contact your local public health authority. The type of vaccine, duration and temperature of the exposure will be taken into account in order to determine the course of action. Serological testing or revaccination may be suggested.

Further information: available from the Public Health Agency of Canada's Website. References:

2) Anaphylaxis Management with vaccine administration:

1) Patients should be kept under supervision for 15 minutes (JE-VAX: 30 minutes) following administration.
2) In order to treat anaphylaxis perform the following steps (note steps a-d should be performed rapidly or simultaneously, however the priority is to complete step a):
   a) **Promptly administer 0.01 mL/kg (maximum 0.5 mL) of aqueous epinephrine 1:1000 by intramuscular (or subcutaneous) injection in the opposite limb to that in which the vaccination was given (or the vastus lateralis). Prompt administration is essential.**
   b) Call for an ambulance
   c) Place the patient in a recumbent position, and elevate their feet.
   d) If necessary, establish an oral airway.
   e) Patients with severe reactions such as cyanosis, dyspnea, should be given oxygen if it is available. Pulse oximetry can be used to monitor if available.
   f) If the vaccine was administered subcutaneously, an additional dose of 0.005 mL/kg (maximum 0.3 mL) of aqueous epinephrine 1:1000, can be injected into the vaccination site to slow down absorption. This should be done shortly after administration of the first dose of epinephrine in moderate to severe cases, and generally should not be repeated. Local injection of epinephrine into an intramuscular vaccination site is contraindicated, as it speeds up absorption of the vaccine.
   g) A dose of diphenhydramine hydrochloride (Benadryl®) can be given as an adjunct to epinephrine. The oral route of diphenhydramine is preferred for conscious patients who are not seriously ill (as the intramuscular injection is painful). Oral dose: 1-2 mg/kg to a maximum single dose of 50 mg.
   h) An inhaled β-agonist should be considered if there is a bronchospasm resistant to an adequate dose of epinephrine (e.g., nebulized salbutamol 2.5-5.0 mg in 3 mL of saline or 1 puff per 3 kg to a maximum of 10 puffs by metered dose inhalers).
   i) Vital signs should be monitored continuously.
   j) Patient should be transported to emergency department for long term monitoring.

◆Epinephrine dosing can be repeated twice at 5-minute intervals if necessary, for a total of three doses. The limb in which the vaccination was given should be avoided. A different limb is preferred for each dose to maximize drug absorption.

3) **Breastfeeding and Vaccinations:** Immunizations for actively breastfeeding women are considered safe, with the exception of smallpox vaccine and yellow fever, by both the CDC and the American academy of pediatrics. Breastfeeding does not appear to influence the maternal immune response. Vaccines do not appear to affect the safety of breast milk for infants.[10,11]

The evidence to support the efficacy of pneumococcal polysaccharide vaccine (PPV) in adults is limited at best. The best studies have not shown a consistent benefit, particularly in the most vulnerable populations that we currently target. The impact of increasing herd immunity due to infant vaccination using conjugate vaccines is another factor, although that is not addressed by this analysis. An accompanying editorial argues that some studies excluded for methodologic limitations should have been included, and vice versa, and called for additional well-designed studies in relevant populations rather than a cessation of the vaccination. FDA Oct/10 Rotarix: The risk of intussusception with Rotarix has been evaluated in a hospital-based Postmarketing Active Surveillance Study (PASS) in a birth cohort of infants in Mexico. An interim analysis of this study suggests an increased risk of intussusception in the 31-day period following administration of the first dose of Rotarix[Relative Risk: 1.8 (99% CI: 1.0, 3.1)]. In this study, within the 31-day period after the first dose, most cases of intussusception occurred in the first 7 days.

Health Canada May/10 is advising Canadians and Canadian healthcare practitioners that we are currently reviewing new information regarding the presence of porcine circovirus (PCV-1 and PCV-2) DNA in rotavirus vaccines. Porcine circovirus is a single stranded DNA virus, and is considered a contaminant in these vaccines.

Jansen AG, Hak E, Veenhoven RH, et al. Pneumococcal conjugate vaccines for preventing otitis media. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD001480. Based on current evidence of the effectiveness of PCVs for the prevention of AOM, the currently licensed 7-valent PCV administered during infancy has marginal beneficial effects. Discrete reductions of 6% to 7% may mean substantial reductions from a public health perspective. Administering PCV7 in older children with a history of AOM appears to have no benefit in preventing further episodes.

Jefferson T, Di Pietrantonj C, Rivetti A, et al. Vaccines for preventing influenza in healthy adults. Cochrane Database Syst Rev. 2010 Jul 7;7:CD001269. Influenza vaccines have a modest effect in reducing influenza symptoms and working days lost. There is no evidence that they affect complications, such as pneumonia, or transmission.

Jefferson T, Rivetti A, Di Pietrantonj C, et al. Vaccines for preventing **influenza** in healthy children. Cochrane Database Syst Rev. 2012 Aug 15;8:CD004879. : Influenza vaccines are efficacious in preventing cases of influenza in children older than two years of age, but little evidence is available for children younger than two years of age. There was a difference between vaccine efficacy and effectiveness, partly due to differing datasets, settings and viral circulation patterns. No safety comparisons could be carried out, emphasising the need for standardisation of methods and presentation of vaccine safety data in future studies. In specific cases, influenza vaccines were associated with serious harms such as narcolepsy and febrile convulsions.

Prevnar 13: December 22, 2009 -- Health Canada has approved a pneumococcal 13-valent conjugate vaccine (Diphtheria CRM197 Protein [Prevnar 13] for children aged 6 weeks through 5 years for active immunisation against invasive pneumococcal disease. The 13-valent vaccine is designed to provide the broadest coverage of any pneumococcal conjugate vaccine. The new vaccine includes strains 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F -- responsible for the greatest remaining burden of invasive disease in young children worldwide.

Rabies CDC recommendations Mar/2010 : Mar/10 Routine **rabies post-exposure prophylaxis** will now entail a total of five shots — four of vaccine and one of rabies immune globulin — according to an article in MMWR Recommendations and Reports. The change to fewer doses was made based on studies showing that the fifth vaccine shot did not improve outcomes. The Advisory Committee on Immunization Practices recommends: Two shots — one of vaccine and one of rabies immune globulin — given as soon as possible after exposure. Taking the day of the first shots as Day 0, the other vaccine shots should be administered on Days 3, 7, and 14. If immune globulin is not given on Day 0, it should be given by Day 7. Immunocompromised patients should continue to receive all five vaccine shots, with the fifth on Day 28. Vaccine shots may be delivered to the outer aspect of the thigh in younger children and to the deltoid in older children and adults. The gluteal region should never be used.The authors note that their recommendations will differ from vaccine label instructions into the foreseeable future.MMWR Recommendations and Reports: http://cdc.gov/mmwr/preview/mmwrhtml/rr5902a1.htm

Anti-inflammatory properties of topical antifungal preparations:

It is difficult to determine the anti-inflammatory effects of topical antifungals in humans as the majority of studies are completed as *in vitro* studies or in animal models. Some studies compared antifungal drugs alone to a combination of antifungal plus steroid combination and had similar efficacies in treatment. A small study (n=20) assessed and compared *in vivo* anti-inflammatory effects of terbinafine, ciclopirox, ketoconazole and other antifungals (econazole, oxiconazole- not commonly used in Canada) with hydrocortisone 2.5%. This study looked at the ability to decrease erythema due to UVB exposure which is thought to mimic the response in dermatophyte infections. It did not study the effects in an actual dermatophyte–induced inflammatory reaction. Terbinafine, ciclopirox, and ketoconazole all demonstrated anti-inflammatory effects. Terbinafine and ciclopirox exhibited statistically significant difference in erythema when compared to control than ketoconazole, econazole, oxiconazole, and hydrocortisone. Ketoconazole exhibited intermediate anti-inflammatory effects. May consider use of these antifungals if there is an inflammatory component to the fungal infection.

Ahovuo-Saloranta A, Borisenko OV, Kovanen N, et al. Antibiotics for acute maxillary **sinusitis**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD000243. Antibiotics have a small treatment effect in patients with uncomplicated acute sinusitis in a primary care setting with symptoms for more than seven days. However, 80% of participants treated without antibiotics improve within two weeks. Clinicians need to weigh the small benefits of antibiotic treatment against the potential for adverse effects at both the individual and general population level.

Ahovuo-Saloranta A, Rautakorpi UM, Borisenko OV, et al. Antibiotics for acute maxillary **sinusitis** in adults. Cochrane Database Syst Rev. 2014 Feb 11;2:CD000243. There is moderate evidence that antibiotics provide a small benefit for clinical outcomes in immunocompetent primary care patients with uncomplicated acute sinusitis. However, about 80% of participants treated without antibiotics improved within two weeks. Clinicians need to weigh the small benefits of antibiotic treatment against the potential for adverse effects at both the individual and general population levels.

Altamimi S, Khalil A, Khalaiwi KA, et al. Short versus standard duration antibiotic therapy for **acute streptococcal pharyngitis in children**. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD004872. Three to six days of oral antibiotics had comparable efficacy compared to the standard duration 10 day oral penicillin in treating children with acute GABHS pharyngitis. In countries with low rates of rheumatic fever, it appears safe and efficacious to treat children with acute GABHS pharyngitis with short duration antibiotics. In areas where the prevalence of rheumatic heart disease is still high, our results must be interpreted with caution.

Altamimi S, Khalil A, Khalaiwi KA, et al. Short-term late-generation antibiotics versus longer term penicillin for **acute streptococcal pharyngitis** in children. Dhiwakar M, Clement WA, Supriya M, McKerrow W. Antibiotics to reduce **post-tonsillectomy** morbidity. Cochrane Database Syst Rev. 2010 Jul 7;7:CD005607. The present systematic review, including meta-analyses for select outcomes, suggests that although individual studies vary in their findings, there is no evidence to support a consistent, clinically important impact of antibiotics in reducing the main morbid outcomes following tonsillectomy (i.e. pain, need for analgesia and secondary haemorrhage rates). Limited benefit apparent with antibiotics may be a result of positive bias introduced by several important methodological shortcomings in the included trials. Based on existing evidence therefore, we would advocate against the routine prescription of antibiotics to patients undergoing tonsillectomy. Whether a subgroup of patients who might benefit from selective administration of antibiotics exists is unknown and needs to be explored in future trials.

Herath SC, Poole P. **Prophylactic antibiotic therapy** for chronic obstructive pulmonary disease (COPD). Cochrane Database of Systematic Reviews 2013, Issue 11. Art. No.: CD009764. DOI: 10.1002/14651858.CD009764.pub2. Use of continuous prophylactic antibiotics results in a clinically significant benefit in reducing exacerbations in COPD patients. All trials of continuous antibiotics used macrolides hence the noted benefit applies only to the use of continuous macrolide antibiotics. The impact of pulsed antibiotics remains uncertain and requires further research. The trials in this review included patients who were frequent exacerbators and needed treatment with antibiotics or systemic steroids, or who were on supplemental oxygen. There were also older individuals with a mean age of 66 years. The results of these trials apply only to the group of patients who were studied in these trials and may not be generalisable to other groups. Because of concerns about antibiotic resistance and specific adverse effects, consideration of prophylactic antibiotic use should be mindful of the balance between benefits to individual patients and the potential harms to society created by antibiotic overuse.

Karageorgopoulos DE, Giannopoulou KP, Grammatikos AP, et al. Fluoroquinolones compared with beta-lactam antibiotics for the treatment of **acute bacterial sinusitis**: a meta-analysis of randomized controlled trials. CMAJ. 2008 Mar 25;178(7):845-54. In the treatment of acute bacterial sinusitis, newer fluoroquinolones conferred no benefit over beta-lactam antibiotics. The use of fluoroquinolones as first-line therapy cannot be endorsed. The authors found no benefit to fluoroquinolones over beta-lactams for acute bacterial rhinosinusitis (ABRS). The more important and relevant questions are whether we can distinguish ABRS from viral sinusitis (not very well) and whether antibiotics are needed at all (probably not for most patients). If you decide to prescribe an antibiotic because of severity of illness or duration of symptoms, a beta-lactam will work as well as a fluoroquinolone. (LOE = 1a)

Koning S, van der Sande R, Verhagen AP, et al. **Interventions for impetigo**. Cochrane Database Syst Rev. 2012 Jan 18;1:CD003261. There is good evidence that topical mupirocin and topical fusidic acid are equally, or more, effective than oral treatment. Due to the lack of studies in people with extensive impetigo, it is unclear if oral antibiotics are superior to topical antibiotics in this group. Fusidic acid and mupirocin are of similar efficacy. Penicillin was not as effective as most other antibiotics. There is a lack of evidence to support disinfection measures to manage impetigo.

LemiengreMB, van Driel ML,Merenstein D, Young J, De Sutter AIM. **Antibiotics for clinically diagnosed acute rhinosinusitis** in adults. Cochrane Database of Systematic Reviews 2012, Issue 10. Art. No.: CD006089. DOI: 10.1002/14651858.CD006089.pub4. The potential benefit of antibiotics in the treatment of clinically diagnosed acute rhinosinusitis needs to be seen in the context of a high prevalence of adverse events. Taking into account antibiotic resistance and the very low incidence of serious complications, we conclude that there is no place for antibiotics for the patient with clinically diagnosed, uncomplicated acute rhinosinusitis. This review cannot make recommendations for children, patients with a suppressed immune system and patients with severe disease, as these populations were not included in the available trials.

Smith SM, Fahey T, Smucny J, et al. **Antibiotics for acute bronchitis**. Cochrane Database Syst Rev. 2014 Mar 1;3:CD000245. There is limited evidence to support the use of antibiotics in acute bronchitis. Antibiotics may have a modest beneficial effect in some patients such as frail, elderly people with multimorbidity who may not have been included in trials to date. However, the magnitude of this benefit needs to be considered in the broader context of potential side effects, medicalisation for a self-limiting condition, increased resistance to respiratory pathogens and cost of antibiotic treatment.

Spinks A, Glasziou PP, DelMar CB. **Antibiotics for sore throat**. Cochrane Database of Systematic Reviews 2013, Issue 11. Art. No.: CD000023. DOI: 10.1002/14651858.CD000023.pub4. Antibiotics confer relative benefits in the treatment of sore throat. However, the absolute benefits are modest. Protecting sore throat sufferers against suppurative and non-suppurative complications in high-income countries requires treating many with antibiotics for one to benefit. This NNTB may be lower in low-income countries. Antibiotics shorten the duration of symptoms by about 16 hours overall.
Spurling GK, Del Mar CB, Dooley L, et al. **Delayed antibiotics** for respiratory infections. Cochrane Database Syst Rev. 2013 Apr 30;4:CD004417. doi: 10.1002/14651858.CD004417.pub4. Most clinical outcomes show no difference between strategies. Delay slightly reduces patient satisfaction compared to immediate antibiotics (87% versus 92%) but not compared to none (87% versus 83%). In patients with respiratory infections where clinicians feel it is safe not to prescribe antibiotics immediately, no antibiotics with advice to return if symptoms do not resolve is likely to result in the least antibiotic use, while maintaining similar patient satisfaction and clinical outcomes to delayed antibiotics.

tonsillopharyngitis. Limited evidence in adults suggests cephalosporins are more effective than penicillin for relapse, but the NNTB is high.
van Driel ML, De Sutter AI, Keber N, et al. Different antibiotic treatments for **group A streptococcal pharyngitis**. Cochrane Database Syst Rev. 2013 Apr 30;4:CD004406. doi: 10.1002/14651858.CD004406.pub3. Evidence is insufficient to show clinically meaningful differences between antibiotics for GABHS tonsillopharyngitis. Limited evidence in adults suggests cephalosporins are more effective than penicillin for relapse, but the NNTB is high. Limited evidence in children suggests carbacephem is more effective for symptom resolution. Data on complications are too scarce to draw conclusions. Based on these results and considering the low cost and absence of resistance, penicillin can still be recommended as first choice.

Venekamp RP, Sanders S, Glasziou PP, et al. Antibiotics for acute otitis media in children. Cochrane Database Syst Rev. 2013 Jan 31;1:CD000219. doi: 10.1002/14651858.CD000219.pub3. Antibiotic treatment led to a statistically significant reduction of children with AOM experiencing pain at two to seven days compared with placebo but since most children (82%) settle spontaneously, about 20 children must be treated to prevent one suffering from ear pain at two to seven days. Additionally, antibiotic treatment led to a statistically significant reduction of tympanic membrane perforations (NNTB 33) and contralateral AOM episodes (NNTB 11). These benefits must be weighed against the possible harms: for every 14 children treated with antibiotics, one child experienced an adverse event (such as vomiting, diarrhoea or rash) that would not have occurred if antibiotics had been withheld. Antibiotics appear to be most useful in children under two years of age with bilateral AOM, or with both AOM and otorrhoea. For most other children with mild disease, an expectant observational approach seems justified. We have no trials in populations with higher risks of complications.

Azarpazhooh A, Limeback H, Lawrence HP, et al. **Xylitol** for preventing acute otitis media in children up to 12 years of age. Cochrane Database of Systematic Reviews 2011, Issue 11. Art. No.: CD007095. DOI: 10.1002/14651858.CD007095.pub2. There is fair evidence that the prophylactic administration of xylitol among healthy children attending day care centres reduces the occurrence of AOM by 25%.
Venekamp RP, Sanders S, Glasziou PP, et al. Antibiotics for acute otitis media in children. Cochrane Database Syst Rev. 2013 Jan 31;1:CD000219. doi: 10.1002/14651858.CD000219.pub3. Antibiotic treatment led to a statistically significant reduction of children with AOM experiencing pain at two to seven days compared with placebo but since most children (82%) settle spontaneously, about 20 children must be treated to prevent one suffering from ear pain at two to seven days. Additionally, antibiotic treatment led to a statistically significant reduction of tympanic membrane perforations (NNTB 33) and contralateral AOM episodes (NNTB 11). These benefits must be weighed against the possible harms: for every 14 children treated with antibiotics, one child experienced an adverse event (such as vomiting, diarrhoea or rash) that would not have occurred if antibiotics had been withheld. Antibiotics appear to be most useful in children under two years of age with bilateral AOM, or with both AOM and otorrhoea. For most other children with mild disease, an expectant observational approach seems justified. We have no trials in populations with higher risks of complications.

18. Mills GD, Oehley MR, Arrol B. Effectiveness of {beta} lactam antibiotics compared with antibiotics active against atypical pathogens in non-severe community acquired pneumonia: meta-analysis. BMJ 2005; 330:456-60. (InfoPOEMs: Strange, but true: Oral beta-lactam antibiotics -- amoxicillin, amoxicillin/clavulanate (Augmentin), or a cephalosporin -- are as effective in the treatment of community-acquired pneumonia as antibiotics active against atypical pathogens, even in patients infected with Mycoplasma pneumoniae or Chlamydia pneumoniae. These old standbys can be used instead of the more expensive drugs for most patients. Legionella infection still requires treatment with an antibiotic effective against atypical pathogens, but in these studies only 1.1% of the patients with nonsevere pneumonia had Legionella. These results are backed up by similar findings from clinical practice (Hedlund J, et al. Scand J Infect Dis 2002; 34:887-92). (LOE = 1a))
19. Golden MR, Whittington WL, et al. Effect of expedited treatment of sex partners on recurrent or persistent gonorrhea or chlamydial infection. N Engl J Med 2005; 352:676-85. (InfoPOEMs: Giving the pt a prescription for their partner(s) or having a staff member contact the pt's partners directly to offer treatment without an examination slightly reduces the risk of recurrent infection in the original pt. It is most helpful for patients with gonorrhea. (LOE = 1b-))
20. Olympia RP, et al. Effectiveness of oral dexamethasone in the treatment of moderate to severe pharyngitis in children. Arch Pediatr Adolesc Med 2005; 159:278-82. (InfoPOEMs: Children with moderate to severe throat pain, given a single oral dose of dexamethasone, experience faster resolution of pain and significant relief in the first 24 hours than those given placebo. After 24 hours, however, there was no significant difference in pain between groups. Interestingly, dexamethasone is more effective in children who test negative for strep. In fact, those who have a positive rapid strep assay are unlikely to have any benefit. This study is too small to have detected any important but uncommon complications of treatment. (LOE = 2b))

22. Richard Andraws, MD; Jeffrey S. Berger, MD; David L. Brown, MD. Effects of Antibiotic Therapy on Outcomes of Patients With Coronary Artery Disease: A Meta-analysis of Randomized Controlled Trials. JAMA. 2005;293:2641-2647. (Evidence available to date does not demonstrate an overall benefit of antibiotic therapy in reducing mortality or cardiovascular events in patients with CAD.)
23. Rovers MM, Black N, Browning GG, Maw R, Zielhuis GA, Haggard MP. Grommets in otitis media with effusion: an individual patient data meta-analysis. Arch Dis Child 2005; 90:480-85. (InfoPOEMs: Compared with watchful waiting, inserting pressure-equalizing tubes improves hearing in children with otitis media with effusion over the short term. Outcomes within 18 months, however, are the same. The tubes has no effect on language development. Watchful waiting is a reasonable option in most of these children. (LOE = 1a))
24. Gafter-Gvili A, Fraser A, Paul M, Leibovici L. Meta-analysis: antibiotic prophylaxis reduces mortality in neutropenic patients. Ann Intern Med. 2005 Jun 21;142(12 Pt 1):979-95. CONCLUSIONS: Antibiotic prophylaxis for neutropenic patients undergoing cytotoxic therapy reduces mortality. Mortality was substantially reduced when analysis was limited to fluoroquinolones. Antibiotic prophylaxis, preferably with a fluoroquinolone, should be considered for neutropenic patients.
25. Fuller JD, Low DE. A review of Streptococcus pneumoniae infection treatment failures associated with fluoroquinolone resistance. Clin Infect Dis. 2005 Jul 1;41(1):118-21. Epub 2005 May 26. There were 20 ciprofloxacin and levofloxacin treatment failures reported. Physicians should be aware, when treating pneumococcal respiratory tract infections in older patients with a fluoroquinolone, that clinical failures might occur, especially for patients with comorbid illnesses and a history of recent fluoroquinolone use.
26. Little P, Rumsby K, et al. Information leaflet & antibiotic prescribing strategies for acute lower respiratory tract infection: an RCT. JAMA. 2005 Jun 22;293(24):3029-35. CONCLUSION: No offer or a delayed offer of antibiotics for acute uncomplicated lower respiratory tract infection is acceptable, associated with little difference in symptom resolution, and is likely to considerably reduce antibiotic use and beliefs in the effectiveness of antibiotics.
27. Doern GV, Richter SS, Miller A, et al. Antimicrobial resistance among Streptococcus pneumoniae in the United States: have we begun to turn the corner on resistance to certain antimicrobial classes? Clin Infect Dis. 2005 Jul 15;41(2):139-48. Epub 2005 Jun 7.
28. Sharland M, Kendall H, Yeates D, et al. Antibiotic prescribing in general practice and hospital admissions for peritonsillar abscess, mastoiditis, and rheumatic fever in children:

time trend analysis. BMJ. 2005 Aug 6;331(7512):328-9. A fall of 50% in the prescribing of antibiotics to children in English general practice has not been accompanied by an increase in hospital admissions for peritonsillar abscess or rheumatic fever. (InfoPOEMs: More judicious prescribing of antibiotics for childhood respiratory infections has not increased the number of episodes of peritonsillar abscess or rheumatic fever. The effect on mastoidectomy is unclear, but a clinically important increase appears unlikely. (LOE = 2c))

29. Hoberman A, Dagan R, Leibovitz E, et al. Large dosage amoxicillin/clavulanate, compared with azithromycin, for the treatment of bacterial acute otitis media in children. Pediatr Infect Dis J. 2005 Jun;24(6):525-32. CONCLUSION: Amoxicillin/clavulanate was clinically & bacteriologically more effective than azithromycin among children with bacterial AOM, incl. cases caused by penicillin-resistant S. pneumoniae & beta-lactamase-positive H. influenzae.

Epub 2005 Nov 9. Penicillin non-susceptibility rates were stable over the study period; overall, 21.8% of isolates were resistant. Azithromycin resistance increased from 31.0% in Year 1 to 36.3% in Year 4. Resistance rates for penicillin and azithromycin varied between countries and were highest in France, Spain, South Africa, USA and the Far East. Multidrug resistance in S. pneumoniae did not change significantly over the 4 years, with an overall rate of 38.6%. Telithromycin retained good activity against S. pneumoniae (0.1% of isolates resistant), including multidrug-resistant isolates.

Arch Intern Med. 2005 Sep 26;165(17):1992-2000.(InfoPOEMs: Treating community-acquired pneumonia with antibiotics effective against atypical organisms is no better and no worse than treating with a penicillin or cephalosporin alone. (LOE = 1a))
60. Fourcroy JL, Berner B, Chiang YK, Cramer M, Rowe L, Shore N. Efficacy and safety of a novel once-daily extended-release ciprofloxacin tablet formulation for treatment of uncomplicated urinary tract infection in women. Antimicrob Agents Chemother. 2005 Oct;49(10):4137-43. (InfoPOEMs: A single dose of an extended-release version of ciprofloxacin (Cipro XR) is as effective as the immediate-release version taken twice daily for 3 days. The tiny reduction in the likelihood of gastrointestinal adverse effects (number needed to treat (NNT) = 60 - 80) is likely to be heavily promoted, and must be balanced against the higher cost of this formulation. As we are given more such options, it is important to remember the key elements in choosing a drug: its safety, tolerability, efficacy, price, and simplicity. Although extended-release ciprofloxacin is simpler, it is no more effective and will almost certainly cost more. (LOE = 1b))

J Pediatr. 2006 Sep;149(3):367-372. Probiotics reduce the risk of AAD in children. For every 7 patients that would develop diarrhea while being treated with antibiotics, one fewer will develop AAD if also receiving probiotics. (InfoPOEMs: Probiotics appear to prevent antibiotic-associated diarrhea in children. However, the limited number of trials included in this study, their overall limited quality, and the potential for publication bias suggest that the data are too limited for certainty. (LOE = 1a-))
101. Rovers MM, et al. Antibiotics for **acute otitis media**: a meta-analysis with individual patient data. Lancet. 2006 Oct 21;368(9545):1429-35. Antibiotics seem to be most beneficial in children younger than 2 years of age with bilateral acute otitis media, and in children with both acute otitis media and otorrhoea. For most other children with mild disease an observational policy seems justified.
102. Del Mar CB, Glasziou PP, Spinks AB. Antibiotics for **sore throat**. Cochrane Database Syst Rev. 2006 Oct 18;(4):CD000023. Antibiotics confer relative benefits in the treatment of sore throat. However, the absolute benefits are modest. Protecting sore throat sufferers against suppurative and non-suppurative complications in modern Western society can only be achieved by treating many with antibiotics, most of whom will derive no benefit. In emerging economies (where rates of acute rheumatic fever are high, for example), the number needed to treat may be much lower for antibiotics to be considered effective. Antibiotics shorten the duration of symptoms by about sixteen hours overall.

126. April/07 NEJM: In the face of Congressional subpoenas and unfavorable publicity, reviewers at the FDA were warned at a June 2006 meeting by Andrew von Eschenbach, then the acting FDA commissioner, not to discuss **Ketek** outside the agency. By this time, 23 cases of acute severe liver injury and 12 cases of acute liver failure, 4 of them fatal, had been linked to Ketek. By the end of 2006, Ketek had been implicated in 53 cases of hepatotoxic effects. The FDA did not relabel Ketek to indicate its possible severe hepatotoxicity until 16 months after the first liver-failure cases became public. The withdrawal of approval for two indications, acute bacterial sinusitis and acute exacerbation of chronic bronchitis, for which Ketek's efficacy had never been demonstrated, did not occur until February 12, 2007 — only a day before the Congressional hearing on Ketek.

Lancet. 2008 Mar 15;371(9616):908-14. Common clinical signs and symptoms cannot identify patients with rhinosinusitis for whom treatment is clearly justified. Antibiotics are not justified even if a patient reports symptoms for longer than 7-10 days.
137. Williamson IG, Rumsby K, Benge S, et al. **Antibiotics and topical nasal steroid** for treatment of **acute maxillary sinusitis**: a randomized controlled trial. JAMA. 2007 Dec 5;298(21):2487-96. Neither an antibiotic nor a topical steroid alone or in combination was effective as a treatment for acute sinusitis in the primary care setting.
138. Karageorgopoulos DE, Giannopoulou KP, Grammatikos AP, et al. Fluoroquinolones compared with beta-lactam antibiotics for the treatment of acute bacterial sinusitis: a meta-analysis of randomized controlled trials. CMAJ. 2008 Mar 25;178(7):845-54. In the treatment of **acute bacterial sinusitis**, newer fluoroquinolones conferred no benefit over beta-lactam antibiotics. The use of fluoroquinolones as first-line therapy cannot be endorsed.
139. Rajendran PM, Young D, Maurer T, Chambers H, Perdreau-Remington F, Ro P, Harris H. randomized, double-blind, placebo-controlled trial of cephalexin for treatment of **uncomplicated skin abscesses** in a population at risk for community-acquired methicillin-resistant Staphylococcus aureus infection. Antimicrob Agents Chemother. 2007 Nov;51(11):4044-8. Epub 2007 Sep 10. Simply incising and draining a superficial skin abscess is sufficient treatment and results in a very high cure rate. Adding a beta-lactam antibiotic does not improve outcomes. This is not the final word on this subject -- it is possible, although unlikely, that use of an antibiotic effective against community-acquired methicillin resistant staph aureus (CA-MRSA) would have increased the cure rate, or that this result may not apply in populations with a lower rate of CA-MRSA -- but it supports the increasingly common practice of not prescribing antibiotics following incision and drainage of a superficial skin abscess. (LOE = 1b-)
140. Lennon DR et al. Once-daily Amoxicillin vs Twice-daily Penicillin V in Group A {beta}-Hemolytic **Streprococcus Pharyngitis**. Arch Dis Child. 2008 Mar 12; [Epub ahead of print] This adequately-powered study, **once-daily oral amoxicillin** is not inferior to twice-daily penicillin V for the treatment & eradication of GABHS in children with pharyngitis.
141. Ahovuo-Saloranta A, Borisenko OV, Kovanen N, Varonen H, Rautakorpi UM, Williams JW Jr, Mäkelä M. Antibiotics for acute maxillary sinusitis. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD000243. Antibiotics have a small treatment effect in patients with uncomplicated **acute sinusitis** in a primary care setting with symptoms for more than seven days. However, 80% of participants treated without antibiotics improve within two weeks. Clinicians need to weigh the small benefits of antibiotic treatment against the potential for adverse effects at both the individual and general population level.
142. Pennesi M, et al. Is antibiotic prophylaxis in children with **vesicoureteral reflux** effective in preventing pyelonephritis and renal scars? A randomized, controlled trial. Pediatrics. 2008 Jun;121(6):e1489-94. Epub 2008 May 19. Continuous antibiotic prophylaxis was ineffective in reducing the rate of pyelonephritis recurrence and the incidence of renal damage in children who were younger than 30 months and had vesicoureteral reflux grades II through IV.

The present systematic review, including meta-analyses for select outcomes, suggests that although individual studies vary in their findings, there is no evidence to support a consistent, clinically important impact of antibiotics in reducing the main morbid outcomes following tonsillectomy (i.e. pain, need for analgesia and secondary haemorrhage rates). Limited benefit apparent with antibiotics may be a result of positive bias introduced by several important methodological shortcomings in the included trials. Based on existing evidence therefore, we would advocate against the routine prescription of antibiotics to patients undergoing tonsillectomy. Whether a subgroup of patients who might benefit from selective administration of antibiotics exists is unknown and needs to be explored in future trials.

301. LemiengreMB, van Driel ML,Merenstein D, Young J, De Sutter AIM. **Antibiotics for clinically diagnosed acute rhinosinusitis in adults**. Cochrane Database of Systematic Reviews 2012, Issue 10. Art. No.: CD006089. DOI: 10.1002/14651858.CD006089.pub4. The potential benefit of antibiotics in the treatment of clinically diagnosed acute rhinosinusitis needs to be seen in the context of a high prevalence of adverse events. Taking into account antibiotic resistance and the very low incidence of serious complications, we conclude that there is no place for antibiotics for the patient with clinically diagnosed, uncomplicated acute rhinosinusitis. This review cannot make recommendations for children, patients with a suppressed immune system and patients with severe disease, as these populations were not included in the available trials.

Antibiotic treatment led to a statistically significant reduction of children with AOM experiencing pain at two to seven days compared with placebo but since most children (82%) settle spontaneously, about 20 children must be treated to prevent one suffering from ear pain at two to seven days. Additionally, antibiotic treatment led to a statistically significant reduction of tympanic membrane perforations (NNTB 33) and contralateral AOM episodes (NNTB 11). These benefits must be weighed against the possible harms: for every 14 children treated with antibiotics, one child experienced an adverse event (such as vomiting, diarrhoea or rash) that would not have occurred if antibiotics had been withheld. Antibiotics appear to be most useful in children under two years of age with bilateral AOM, or with both AOM and otorrhoea. For most other children with mild disease, an expectant observational approach seems justified. We have no trials in populations with higher risks of complications.

Most clinical outcomes show no difference between strategies. Delay slightly reduces patient satisfaction compared to immediate antibiotics (87% versus 92%) but not compared to none (87% versus 83%). In patients with respiratory infections where clinicians feel it is safe not to prescribe antibiotics immediately, no antibiotics with advice to return if symptoms do not resolve is likely to result in the least antibiotic use, while maintaining similar patient satisfaction and clinical outcomes to delayed antibiotics.

Cochrane Database Syst Rev. 2013 Apr 30;4:CD004406. doi: 10.1002/14651858.CD004406.pub3. Evidence is insufficient to show clinically meaningful differences between antibiotics for GABHS tonsillopharyngitis. Limited evidence in adults suggests cephalosporins are more effective than penicillin for relapse, but the NNTB is high. Limited evidence in children suggests carbacephem is more effective for symptom resolution. Data on complications are too scarce to draw conclusions. Based on these results & considering the low cost & absence of resistance, penicillin can still be recommended as first choice.

387. Herath SC, Poole P. **Prophylactic antibiotic therapy** for chronic obstructive pulmonary disease (COPD). Cochrane Database of Systematic Reviews 2013, Issue 11. Art. No.: CD009764. DOI: 10.1002/14651858.CD009764.pub2. Use of continuous prophylactic antibiotics results in a clinically significant benefit in reducing exacerbations in COPD patients. All trials of continuous antibiotics used macrolides hence the noted benefit applies only to the use of continuous macrolide antibiotics. The impact of pulsed antibiotics remains uncertain and requires further research. The trials in this review included patients who were frequent exacerbators and needed treatment with antibiotics or systemic steroids, or who were on supplemental oxygen. There were also older individuals with a mean age of 66 years. The results of these trials apply only to the group of patients who were studied in these trials and may not be generalisable to other groups. Because of concerns about antibiotic resistance and specific adverse effects, consideration of prophylactic antibiotic use should be mindful of the balance between benefits to individual patients and the potential harms to society created by antibiotic overuse.

415. Smith SM, Fahey T, Smucny J, et al. **Antibiotics for acute bronchitis.** Cochrane Database Syst Rev. 2014 Mar 1;3:CD000245. There is limited evidence to support the use of antibiotics in acute bronchitis. Antibiotics may have a modest beneficial effect in some patients such as frail, elderly people with multimorbidity who may not have been included in trials to date. However, the magnitude of this benefit needs to be considered in the broader context of potential side effects, medicalisation for a self-limiting condition, increased resistance to respiratory pathogens and cost of antibiotic treatment.

Antibiotics confer relative benefits in the treatment of sore throat. However, the absolute benefits are modest. Protecting sore throat sufferers against suppurative and non-suppurative complications in high-income countries requires treating many with antibiotics for one to benefit. This NNTB may be lower in low-income countries. Antibiotics shorten the duration of symptoms by about 16 hours overall.

[ii] McFarland LV. Meta-analysis of probiotics for the prevention of antibiotic associated diarrhea & treatment of Clostridium difficile disease. Am J Gastroenterol. 2006 Apr;101(4):812-22. (see also Pharmacist's Letter July'06 and Zocco MA, et al. Efficacy of Lactobacillus GG in maintaining remission of ulcerative colitis. Aliment Pharmacol Ther. 2006 Jun 1;23(11):1567-74. InfoPOEMs: Lactobacillus rhamnosus GG (LGG) was as effective as a mesalazine product in preventing recurrence in patients with ulcerative colitis. However, the study was unblinded and a confirmatory study would be helpful. (LOE = 1b-)).(Sazawal S, Hiremath G, Dhingra U, Malik P, Deb S, Black RE. Efficacy of probiotics in prevention of acute diarrhoea: a meta-analysis of masked, randomised, placebo-controlled trials. Lancet Infect Dis. 2006 Jun;6(6):374-82. InfoPOEMs: Probiotics reduce the risk of antibiotic-associated diarrhea and other types of acute diarrhea, but not the risk of traveler's diarrhea, in both children and adults. The protective effect does not vary among different probiotic strains nor by mode of delivery. (LOE = 1a).
(Hickson M, D'Souza AL, Muthu N, et al. Use of probiotic Lactobacillus preparation to prevent diarrhoea associated with antibiotics: randomised double blind placebo controlled trial. BMJ. 2007 Jun 29; [Epub ahead of print] Consumption of a probiotic drink containing L casei, L bulgaricus, and S thermophilus can reduce the incidence of antibiotic associated diarrhoea and C difficile associated diarrhoea. This has the potential to decrease morbidity, healthcare costs, and mortality if used routinely in patients aged over 50.) (Canani RB, Cirillo P, Terrin G, Cesarano L, Spagnuolo MI, De Vincenzo A, Albano F, Passariello A, De Marco G, Manguso F, Guarino A. Probiotics for treatment of acute diarrhoea in children: randomised clinical
trial of five different preparations. BMJ. 2007 Aug 18;335(7615):340. Epub 2007 Aug 9. One day after the first probiotic administration, the daily number of stools was significantly lower (P<0.001) in children who received L rhamnosus strain GG and in those who received the probiotic mix than in the other groups. Not all commercially available probiotic preparations are effective in children with acute diarrhoea.)(Medical Letter. Probiotics. Aug 13,2007.)
Besselink MG, van Santvoort HC, et al.; Dutch Acute Pancreatitis Study Group. Probiotic prophylaxis in predicted severe acute pancreatitis: a randomised,
double-blind, placebo-controlled trial. Lancet. 2008 Feb 23;371(9613):651-9. Epub 2008 Feb 14. In patients with severe pancreatitis, probiotics were no more effective than placebo in preventing infectious complications. Furthermore, there were significantly more deaths in patients receiving probiotics. One would only need to administer probiotics to 11 patients to have 1 extra death. (LOE = 1b)

53. Lok AS et al. Preliminary study of two antiviral agents for hepatitis C genotype 1. N Engl J Med 2012 Jan 19; 366:216. (60 mg daily of daclatasvir (an NS5A replication complex inhibitor) and 600 mg twice daily of asunaprevir (an NS3 protease inhibitor)).
54. FDA Feb/12 notified healthcare professionals and patients that drug interactions between the hepatitis C virus (HCV) protease inhibitor Victrelis (**boceprevir**) and certain **ritonavir-boosted** human immunodeficiency virus (HIV) protease inhibitors (atazanavir, lopinavir, darunavir) can potentially reduce the effectiveness of these medicines when they are used together.
55. Centers for Disease Control and Prevention (CDC). Transmission of hepatitis C virus through **transplanted organs and tissue**--Kentucky and Massachusetts, 2011. MMWR Morb Mortal Wkly Rep. 2011 Dec 23;60(50):1697-700.

56. FDA Mar/12 notified healthcare professionals of updates to the prescribing information concerning interactions between protease inhibitors (HIV & HCV) and certain **statin drugs**. Protease inhibitors and statins taken together may raise the blood levels of statins and increase the risk for muscle injury (myopathy/ rhabdomyolysis).

63. Sterling RK, Wright EC, et al. Frequency of elevated hepatocellular carcinoma-HCC **biomarkers** (AFP-fetoprotein) in patients with advanced hepatitis C. Am J Gastroenterol. 2012 Jan;107(1):64-74.
64. FDA notified healthcare professionals that the Victrelis drug label has been revised to state that co-administration of Victrelis (**boceprevir**), a hepatitis C virus (HCV) protease inhibitor, along with certain **ritonavir**-boosted human immunodeficiency virus (HIV) protease inhibitors, is not recommended. The findings of a drug-drug interaction study and clinical trial showed that co-administration increased of the possibility of reducing the effectiveness of the medicines, permitting the amount of HCV or HIV virus in the blood to increase. Ritonavir-boosted HIV protease inhibitors include ritonavir-boosted Reyataz (atazanavir), ritonavir-boosted Prezista (darunavir), and Kaletra (lopinavir/ritonavir).

Art. No.: CD003617. DOI: 10.1002/14651858.CD003617.pub2. The clinical data were limited to patients with histologic evidence of severe fibrosis who were retreated with pegylated interferon. In this scenario, retreatment with interferon did not appear to provide significant clinical benefit and, when only the trials at low risk of bias were considered, retreatment for several years may even have increased all-cause mortality.

DOI:10.1002/14651858.CD005642.pub3. There is lack of evidence on patient-important outcomes and paucity of evidence on adverse events.Moderate quality evidence suggests that peginterferon alpha-2a is associated with a higher sustained virological response in serum than with peginterferon alpha-2b.

Extras

Combos to Avoid: Early virologic failure: abacavir + lamivudine (or emtricitabine) + tenofovir ; didanosine + lamivudine (or emtricitabine) + tenofovir; didanosine + tenofovir + NNRTI; didanosine + emtricitabine(lamivudine) + atazanavir; Caution: emtricitabine(or lamivudine) + tenofovir + nevirapine [71] (early virologic failure in small clinical trials; ARTEN [72] trial: may be okay)
↑AE: Didanosine + stavudine (peripheral neuropthy, pancreatitis & lactic acidosis); ATV + IDV ↑ bilirubin; 2 NNRTI regimen Antagonism: stavudine + zidovudine

- Oral contraceptives + non-ritonavir boosted atazanavir (may ↑ hormone levels; ⇨use lowest dose OC)[73] or indinavir (will maintain hormone levels)

{Refractory large volume diarrhea, HIV related: octreotide (50-500mcg sc TID)$$$ }[74,75]

191. Okwundu CI, Uthman OA, Okoromah CAN. **Antiretroviral pre-exposure prophylaxis (PrEP)** for preventing HIV in high-risk individuals. Cochrane Database of Systematic Reviews 2012, Issue 7. Art. No.: CD007189. Presently there is no reliable evidence to support the use of any antiretroviral agent for HIV chemoprophylaxis.The value of chemoprophylaxis for HIV prevention cannot be assessed on the basis of the included trial. The result was not statistically significant and, moreover, the trial was not completed as planned; therefore, the use of antiretroviral agents for HIV chemoprophylaxis cannot be recommended at present. To assess the value of antiretroviral agents for HIV chemoprophylaxis, we advocate well-conducted trials with the statistical power to answer questions about PrEP efficacy and safety in various populations and risk groups. These trials also should evaluate other important issues of concern, such as drug safety, adherence, drug resistance, and the effect of PrEP on risk behaviour.

DOI: 10.1002/14651858.CD010929.pub2. YF vaccination can produce protective levels of neutralising antibodies in HIV patients. Immunogenicity of YF vaccine is slightly less in HIV-infected patients compared to HIV-uninfected patients. No serious adverse events related to YF vaccine were observed in HIV-infected study participants. At time of immunisation, higher CD4 cell counts and lower HIV RNA levels in patients with HIV infection seem to be key determinants for development of protective titres of neutralising antibodies.

Since the 2011-12 influenza season, NACI has recommended that egg-allergic individuals may be vaccinated against influenza using TIV, without a prior influenza vaccine skin test, based on an assessment of risk for a severe allergic reaction to guide the method of vaccination. (NACI recommendation Grade A)Footnote bb Details of the vaccine delivery protocols are found below. Because of the lack of data, the use of FluMist® in egg-allergic persons is not recommended at this time. However, ovalbumin concentrations in FluMist® are documented to be very low and a study is currently underway to assess the use of FluMist® in egg-allergic persons. Its use will be re-evaluated when further data become available. Although ovalbumin content in influenza vaccine manufactured in eggs may vary from year to year, between vaccine products or between lots of the same vaccine,Footnote 6363-Footnote 6565 vaccines marketed in Canada are approved under the European specification for ovalbumin content, which is currently <1.2 µg/mL, the level associated with low risks of adverse events.Footnote 6666 An egg-allergic individual is considered to be at higher risk for severe allergic reactions by CSACI if they have had a previous respiratory or cardiovascular reaction or generalized hives when exposed to egg, or have poorly controlled asthma. Two vaccine delivery protocols can be used for egg-allergic individuals, depending on their level of risk for an allergic reaction.Footnote 6767 Egg-allergic individuals at lower risk for severe allergic reaction can be vaccinated for influenza using a single vaccine dose. The two-step graded protocol is recommended for individuals who are at higher risk for severe allergic reaction. These protocols are as follows:

Full dose - A single vaccine dose without the use of a graded challenge. Individuals should be observed for 30 minutes following administration for symptom development.

Two-step graded dosing - A two-step graded process, whereby 10% of the dose is administered followed by 30 minutes of observation. If no symptoms develop, or symptoms are self-resolving, administer the remaining 90% with another 30 minute observation period. If sustained or severe reactions arise after the initial dose, the vaccine is withheld and the individual should be re-evaluated for receipt of the influenza vaccine.

***More recent studies suggest that the absolute risk of GBS in the period following seasonal and A(H1N1)pdm09 influenza vaccination is about one excess case per 1 million vaccines

[6] Kiso M., Resistant influenza A viruses in children treated with oseltamivir: descriptive study. Lancet 2004; 364: 759-65. (9 of 50 treated kids had resistant gene mutations, but transmissibility unknown)

Physician's First Watch: Feb/08 A common influenza virus has developed a mutation resistant to oseltamivir (Tamiflu) has been found in U.S., Canada, & 4 European nations, the *New York Times* reports. A small percentage of **influenza A/H1N1** — the predominant flu virus infecting people this season — is affected by the **H274Y mutation**. Norway appears to be hardest hit, with 75% (12 of 16) of the isolated viruses showing **resistance to oseltamivir**. In the U.S., Britain, Denmark, and France, roughly 3% to 5% of

tested viruses showed resistance (data on Canada were not provided, but reported in Pharmacy Bulletin Board Feb 4/08 at **10%**). "We don't know right now if this is a trend on the upswing or just a small blip," the CDC's chief of epidemiology and prevention told the Associated Press. Officials from the U.S. and World Health Organization told the *Times* they do not currently advise changes in Tamiflu use. In addition, the flu vaccine is still effective against the mutant virus.

Dec/08: Clinicians should remain alert for changes in recommendations that might occur as the 2008--09 influenza season progresses. Recommendations regarding the use of antiviral medications might be revised if surveillance data indicate a substantial and widespread increase in the prevalence of oseltamivir-resistant influenza viruses in the United States. In fact, the interim CDC guidance provides advice for clinicians on how to treat patients with influenza antiviral medications this season. Clinicians can use influenza test results and information, if available, about which viruses are circulating, to help decide which antiviral(s) should be used. If H1N1 viruses are circulating in the community, or it's not clear which viruses are circulating, health care providers are recommended to use an alternative antiviral, zanamivir (Relenza®), or to use combination therapy of oseltamivir and rimantadine. Use of zanamivir or dual therapy with oseltamivir and rimantadine would provide effective treatment against all circulating influenza viruses. In some instances, oseltamivir alone can still be used, such as when influenza B is diagnosed, or H1N1 viruses are not circulating.

Dharan NJ, Gubareva LV, Meyer JJ, et al. for the Oseltamivir-Resistance Working Group. Infections With Oseltamivir-Resistant Influenza A(H1N1) Virus in the United States. JAMA. 2009 Mar 2. [Epub ahead of print] Oseltamivir-resistant A(H1N1) viruses circulated widely in the United States during the 2007-2008 influenza season, appeared to be unrelated to oseltamivir use, and appeared to cause illness similar to oseltamivir-susceptible A(H1N1) viruses. Circulation of oseltamivir-resistant A(H1N1) viruses will continue, with a higher prevalence of resistance, during the 2008-2009 season.

Jefferson T, Jones MA, Doshi P, et al. **Neuraminidase inhibitors for preventing and treating influenza in healthy adults and children.** Cochrane Database Syst Rev. 2014 Apr 10;4:CD008965. Oseltamivir and zanamivir have small, non-specific effects on reducing the time to alleviation of influenza symptoms in adults, but not in asthmatic children. Using either drug as prophylaxis reduces the risk of developing symptomatic influenza. Treatment trials with oseltamivir or zanamivir do not settle the question of whether the complications of influenza (such as pneumonia) are reduced, because of a lack of diagnostic definitions. The use of oseltamivir increases the risk of adverse effects, such as nausea, vomiting, psychiatric effects and renal events in adults and vomiting in children. The lower bioavailability may explain the lower toxicity of zanamivir compared to oseltamivir. The balance between benefits and harms should be considered when making decisions about use of both NIs for either the prophylaxis or treatment of influenza. The influenza virus-specific mechanism of action proposed by the producers does not fit the clinical evidence.

Bright RA, Medina MJ, Xu X, et al. Incidence of adamantane resistance among influenza A (H3N2) viruses isolated worldwide from 1994 to 2005: a cause for concern. Lancet. 2005 Oct 1;366(9492):1175-81. Epub 2005 Sep 22. FINDINGS: More than 7000 influenza A field isolates were screened for specific aminoacid substitutions in the M2 gene known to confer drug resistance. During the decade of surveillance a significant increase in drug resistance was noted, from 0.4% in 1994-1995 to 12.3% in 2003-2004. This increase in the proportion of resistant viruses was weighted heavily by those obtained from **Asia** with 61% of resistant viruses isolated since 2003 being from people in Asia. INTERPRETATION: Our data raise concerns about the appropriate use of adamantanes & draw attention to the importance of tracking the emergence and spread of drug-resistant influenza A viruses.

Bright RA, et al. Adamantane resistance among influenza A viruses isolated early during the 2005-2006 influenza season in the United States. JAMA. 2006 Feb 22;295(8):891-4. Epub 2006 Feb 2. RESULTS: A total of 209 influenza A(H3N2) viruses isolated from patients in 26 states were screened, of which 193 (92.3%) contained a change at amino acid 31 (serine to asparagine [S31N]) in the M2 gene known to be correlated with adamantane resistance. Two of 8 influenza A(H1N1) viruses contained the same mutation. Drug-resistant viruses were distributed across the United States. CONCLUSIONS: The high proportion of influenza A viruses currently circulating in the United States demonstrating adamantane resistance highlights the clinical importance of rapid surveillance for antiviral resistance. Our results indicate that these drugs should not be used for the treatment or prophylaxis of influenza in the United States until susceptibility to adamantanes has been reestablished among circulating influenza A isolates.

CDC July 2009 Prevention and Control of Seasonal Influenza with Vaccines: Recommendations of the Advisory Committee on Immunization Practices (ACIP), **2009** http://www.cdc.gov/mmwr/preview/mmwrhtml/rr58e0724a1.htm ; http://www.cdc.gov/flu/

CDC Centers for Disease Control and Prevention. Updated interim recommendations — **HIV**-infected adults and adolescents: Considerations for clinicians regarding 2009 **H1N1** influenza. Oct 21 , 2009. (http://www.cdc.gov/h1n1flu/guidance_HIV.htm)

CDC data strengthen the evidence that the risk for **Guillain-Barré syndrome (GBS)** associated with the 2009 H1N1 vaccine is similar to the risk seen with seasonal flu vaccines, according to an *MMWR* report. The CDC's analysis of data from October 2009 through March 2010 found that the incidence of GBS was 1.92 per 100,000 person-years among vaccinated individuals and 1.21 per 100,000 person-years among the unvaccinated. If final data confirm this finding, the CDC says, then this would translate to 0.8 excess GBS cases for every 1 million vaccinations — a rate comparable to that found with seasonal flu vaccination. *MMWR* article (Free)

CDC **Prevention and Control of Influenza with Vaccines**. Recommendations of the Advisory Committee on Immunization Practices (ACIP), **2010**. http://www.cdc.gov/mmwr/pdf/rr/rr59e0729.pdf

CDC Preliminary Results: Surveillance for **Guillain-Barré Syndrome** After Receipt of Influenza A (H1N1) 2009 Monovalent Vaccine — United States, 2009–2010 http://www.cdc.gov/mmwr/preview/mmwrhtml/mm59e0602a1.htm Preliminary results from an analysis in EIP comparing GBS patients hospitalized through March 31, 2010, who did and did not receive 2009 H1N1 vaccination showed an estimated age-adjusted rate ratio of 1.77 (GBS incidence of 1.92 per 100,000 person-years among vaccinated persons and 1.21 per 100,000 person-years among unvaccinated persons). If end-of-surveillance analysis confirms this finding, this would correspond to 0.8 excess cases of GBS per 1 million vaccinations, similar to that found in seasonal influenza vaccines.[2,3] No other federal system to date has detected a statistically significant association between GBS and 2009 H1N1 vaccination. Surveillance and further analyses are ongoing. The 2009 H1N1 vaccine safety profile is similar to that for seasonal influenza vaccines, which have an excellent safety record. Vaccination remains the most effective method to prevent serious illness and death from 2009 H1N1 influenza infection; illness from the 2009 H1N1 influenza virus has been associated with a hospitalization rate of 222 per 1 million and a death rate of 9.7 per 1 million population.

EMA Jul 21// - European regulators have recommended restricting the use of GlaxoSmithKline's pandemic flu vaccine **Pandemrix because of a potential risk of narcolepsy** in children or adolescents. The European Medicines Agency said on Thursday that Pandemrix should only be used in people under 20 years in the absence of seasonal trivalent influenza vaccines, following its link to very rare cases of narcolepsy in young people.

Engler RJ, Nelson MR, Klote MM, et al. Walter Reed Health Care System Influenza Vaccine Consortium. **Half- vs full-dose** trivalent inactivated influenza vaccine (2004-2005): age, dose, and sex effects on immune responses. Arch Intern Med. 2008 Dec 8;168(22):2405-14. Antibody responses to intramuscular half-dose TIV in healthy, previously immunized adults were not substantially inferior to the full-dose vaccine, particularly for ages 18 to 49 years. Significantly higher geometric mean titer responses in women were identified for all ages, regardless of dose or influenza strain. Half-dose vaccination may be an effective strategy for healthy adults younger than 50 years in the setting of an influenza vaccine shortage.

FDA Acts to Protect Public from **Fraudulent Avian Flu Therapies** Dec/05 http://www.fda.gov/bbs/topics/NEWS/2005/NEW01274.html

FDA April /08 GlaxoSmithKline informed healthcare professionals of changes to the WARNINGS AND PRECAUTIONS sections of prescribing information for **Relenza** regarding information from postmarketing reports (mostly from Japan) of **delirium and abnormal behavior** leading to injury in patients with influenza who are receiving neuraminidase inhibitors, including Relenza. These events were reported primarily among pediatric patients and often had an abrupt onset and rapid resolution. The contribution of Relenza to these events has not been established. Influenza can be associated with a variety of neurologic and behavioral symptoms which can include seizures, hallucinations, delirium, and abnormal behavior, in some cases resulting in fatal outcomes. These events may occur in the setting of encephalitis or encephalopathy but can occur without obvious severe disease.

FDA June/10 notified consumers and healthcare professionals about a potentially harmful product represented as "**Generic Tamiflu" sold over the Internet**. FDA tests revealed that the fraudulent product does not contain Tamiflu's active ingredient, oseltamivir, but cloxacillin, an ingredient in the same class of antibiotics as penicillin.

Hatakeyama S, Sugaya N, Ito M, et al. Emergence of influenza B viruses with reduced sensitivity to neuraminidase inhibitors. JAMA. 2007 Apr 4;297(13):1435-42. In 1 (1.4%) of the 74 children who had received oseltamivir, we identified a variant with reduced drug sensitivity possessing a Gly402Ser neuraminidase substitution. We also identified variants with reduced sensitivity carrying an Asp198Asn, Ile222Thr, or Ser250Gly mutation in 7 (1.7%) of the 422 viruses from untreated patients. In this population, influenza B viruses with reduced sensitivity to neuraminidase inhibitors do not arise as frequently as resistant influenza A viruses. However, they appear to be transmitted within communities and families, requiring continued close monitoring.

Jefferson T, et al. Vaccines for preventing influenza in **healthy children**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD004879. Influenza vaccines are efficacious in children older than two but little evidence is available for children under two. There was a marked difference between vaccine efficacy and effectiveness. No safety comparisons could be carried out, emphasizing the need for standardisation of methods and presentation of vaccine safety data in future studies. It was surprising to find only one study of inactivated vaccine in children under two years, given current recommendations to vaccinate healthy children from six months old in the USA and Canada. If immunisation in children is to be recommended as a public health policy, large-scale studies assessing important outcomes and directly comparing vaccine types are urgently required.

Jefferson T, Jones M, Doshi P, Del Mar C. **Possible harms of oseltamivir**—a call for urgent action. Lancet. 2009 Oct 17;374(9698):1312-3.

Jefferson Tom, Jones Mark, Doshi Peter, et al. **Neuraminidase inhibitors** for preventing and treating influenza in healthy **adults**: systematic review and meta-analysis. BMJ 2009;339:b5106, doi: 10.1136/bmj.b5106 (Published 8 December 2009) . Neuraminidase inhibitors have modest effectiveness against the symptoms of influenza in otherwise healthy adults. The drugs are effective postexposure against laboratory confirmed influenza, but this is a small component of influenza-like illness, so for this outcome neuraminidase inhibitors are not effective.

Jefferson T, Di Pietrantonj C, Rivetti A, et al. **Vaccines for preventing influenza** in healthy adults. Cochrane Database Syst Rev. **2010** Jul 7;7:CD001269. Influenza vaccines have a modest effect in reducing influenza symptoms and working days lost. There is no evidence that they affect complications, such as pneumonia, or transmission.

Jefferson T, Jones MA, Doshi P, et al. Neuraminidase inhibitors for preventing and treating influenza in healthy adults and children - a review of clinical study reports. Cochrane Database of Systematic Reviews 2011, Issue 1. Art. No.: CD008965. DOI: 10.1002/14651858.CD008965. We found a high risk of publication and reporting biases in the trial programme of oseltamivir. Sub-population analyses of the influenza infected population in the oseltamivir trial programme are not possible because the two arms are non-comparable due to oseltamivir's apparent interference with antibody production. The evidence supports a direct oseltamivir mechanism of action on symptoms but we are unable to draw conclusions about its effect on complications or transmission. We expect full clinical study reports containing study protocol, reporting analysis plan, statistical analysis plan and individual patient data to clarify outstanding issues. These full clinical study reports are at present unavailable to us.

Jefferson T, Rivetti A, Di Pietrantonj C, et al. **Vaccines for preventing influenza in healthy children**. Cochrane Database Syst Rev. 2012 Aug 15;8:CD004879. : Influenza vaccines are efficacious in preventing cases of influenza in children older than two years of age, but little evidence is available for children younger than two years of age. There was a difference between vaccine efficacy and effectiveness, partly due to differing datasets, settings and viral circulation patterns. No safety comparisons could be carried out, emphasising the need for standardisation of methods and presentation of vaccine safety data in future studies. In specific cases, influenza vaccines were associated with serious harms such as narcolepsy and febrile convulsions.

Jefferson T, Doshi P. **Multisystem failure**: the story of anti-influenza drugs. *BMJ* 2014;348:g2263.

Jefferson T, Jones MA, Doshi P, et al. **Neuraminidase inhibitors for preventing and treating influenza in healthy adults and children.** Cochrane Database Syst Rev. 2014 Apr 10;4:CD008965. Oseltamivir and zanamivir have small, non-specific effects on reducing the time to alleviation of influenza symptoms in adults, but not in asthmatic children. Using either drug as prophylaxis reduces the risk of developing symptomatic influenza. Treatment trials with oseltamivir or zanamivir do not settle the question of whether the complications of influenza (such as pneumonia) are reduced, because of a lack of diagnostic definitions. The use of oseltamivir increases the risk of adverse effects, such as nausea, vomiting, psychiatric effects and renal events in adults and vomiting in children. The lower bioavailability may explain the lower toxicity of zanamivir compared to oseltamivir. The balance between benefits and harms should be considered when making decisions about use of both NIs for either the prophylaxis or treatment of influenza. The influenza virus-specific mechanism of action proposed by the producers does not fit the clinical evidence.

Thomas RE, Jefferson T, Lasserson TJ. Influenza **vaccination for healthcare workers** who work with the elderly. Cochrane Database Syst Rev. 2010 Feb 17;(2):CD005187.

Thomas RE, Jefferson T, Lasserson TJ. Influenza **vaccination for healthcare workers** who care for people aged 60 or older living in long-term care institutions. Cochrane Database Syst Rev. 2013 Jul 22;7:CD005187. The results for specific OUTCOMES: laboratory-proven influenza or its complications (lower respiratory tract infection, or hospitalisation or death due to lower respiratory tract illness) did not identify a benefit of healthcare worker vaccination on these key outcomes. This review did not find information on co-interventions with healthcare worker vaccination: hand-washing, face masks, early detection of laboratory-proven influenza, quarantine, avoiding admissions, antivirals and asking healthcare workers with influenza or influenza-like-illness (ILI) not to work. This review does not provide reasonable evidence to support the vaccination of healthcare workers to prevent influenza in those aged 60 years or older resident in LTCIs.

WHO Jan 18/07 - Two people who died of bird flu in Egypt last month had a strain of the H5N1 virus that has shown moderate resistance to the frontline antiviral Tamiflu, the World Health Organization (WHO) said on Thursday. http://www.who.int/csr/disease/avian_influenza/en/index.html

WHO May 2007, New data published by the World Health Organization (WHO) has confirmed a low frequency of resistance to the flu drug Tamiflu between 2003 and 2006, Roche announced. The information, published by WHO's Neuraminidase Inhibitor Susceptibility Network, shows that resistance to Tamiflu (oseltamivir) of approximately 0.3 percent was seen during the past three influenza seasons, during which the drug was used extensively in Japan. This level of resistance is extremely low compared with the 65 percent rate seen in Japan with another antiviral, amantadine.

Zaman K, Roy E, Arifeen SE, Rahman M, Raqib R, et al.. Effectiveness of **Maternal Influenza Immunization** in Mothers and Infants. N Engl J Med. 2008 Sep 17. [Epub ahead of print] Inactivated influenza vaccine reduced proven influenza illness by 63% in infants up to 6 months of age and averted approximately a third of all febrile respiratory illnesses in mothers and young infants. Maternal influenza immunization is a strategy with substantial benefits for both mothers and infants.

WEBSITES & Updates:

Update: Influenza Activity --- United States, September 28--November 29, 2008

During September 28--November 29, 2008, influenza activity remained low in the United States. Of the few influenza viruses characterized thus far this season, **most are antigenically** related to the strains included in the 2008--09 influenza **vaccine**. Oseltamivir-resistant influenza A (H1N1) viruses have been detected, but currently available data are insufficient to predict their prevalence for the 2008--09 season. This report summarizes U.S. influenza activity* since the last update (1) and reviews new influenza vaccine recommendations for the current season. During September 28--November 29, 2008, approximately 150 World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System collaborating laboratories in the United States tested 24,657 respiratory specimens for influenza viruses; 365 (1.5%) were positive (Figure 1). Of these, 282 (77.3%) were influenza A viruses, and 83 (22.7%) were influenza B viruses. One hundred twenty-eight (45.4%) of the 282 influenza A viruses were subtyped; 112 (87.5%) of these were influenza A (H1) viruses, and 16 (12.5%) were influenza A (H3) viruses. Influenza-positive tests have been reported from 26 states in eight of the nine surveillance regions since September 28.

Enhanced surveillance for oseltamivir-resistant viruses is ongoing at CDC. Alternatives for antiviral treatment in the context of widely circulating **oseltamivir-resistant** viruses have been suggested. These treatment options, which might include preferential use of zanamivir or therapy with a combination of antivirals for certain patients, have been outlined in the ACIP 2008 influenza recommendations.†† Currently, the neuraminidase inhibitors oseltamivir and zanamivir remain the recommended medications for treatment and chemoprophylaxis of influenza. Clinicians should **remain alert for changes in recommendations** that might occur as the 2008--09 influenza season progresses. Recommendations regarding the use of antiviral medications might be revised if surveillance data indicate a substantial and widespread increase in the prevalence of oseltamivir-resistant influenza viruses in the United States. http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5749a3.htm?s_cid=mm5749a3_e

Primaquine 26.3mg tab (= 15mg base) ✗▼ PL

Terminal prophylaxis: effective against P. *vivax* & P. *ovale*. Used for pts that have had long exposure to malaria endemic areas (>8wks)[36]. Not required for travel to Haiti or the Dominican Republic as of July06 [2].

- **Chloroquine/doxycycline/mefloquine prophylaxis**: primaquine taken in conjunction with the last 2 wks of post-exposure prophylaxis, but may be taken immediately after.
- **Atovaquone/proguanil prophylaxis:** primaquine is taken during atovaquone/ proguanil post-exposure prophylaxis & then for an additional 7-14 days after.

Primaquine eradicates latent parasites in the liver & rapidly kills mature gametocytes (even falciparum).

Pediatric Dosing age >9yrs for prevention; any age for tx

Prophylaxis: 0.5 mg(base)/kg/day
Terminal Prophylaxis: 0.5 mg/kg/day x14d

Adult Dosing

Prophylaxis: 52.6 mg (30 mg base) DAILY $9
Terminal Proph.: 30 mg base/d x 14d $9

For prophylaxis: begin 1-2d prior to entering

Comments

Second-line for chloroquine resistant areas

- 85- 95% effective against P. *falciparum* & P. *vivax*
- **Only therapy to prevent relapse from P. vivax & P.ovale** due to dormant hypnozoites in liver (relapse may occur within 5 years of exposure)

CI: **G6PD deficiency**/favism, pregnancy,rh. arthritis, lupus
SE: Well tolerated. GI upset; Take with food.
Missed Dose: Take next dose ASAP. However, if it is almost time for your next dose, skip the missed dose & go back to your regular dosing schedule. Do not double doses. **Take with food; not grapefruit juice**

Drug Treatment of Malaria: Tx will vary depending on species of malaria. For severe: (IV quinine or artesunate) + (Atovaquone/proguanil or doxycycline or clindamycin)

Other Investigational Drugs: **IV artesunate**: investigational in the USA for treatment of severe malaria. {May be accessed in Canada through the Canadian Malarial Network. It is an alternative to quinine with less side effects, although limited long term experience with potential side effects from recurrent use.}

{Recent historical resistance trends: {choroquine sensitive areas: travel to **Caribbean** including Haiti and rural areas of Dominican Republic; travelers visiting resort areas not generally at risk; travel to Central America except Panama, Mexico, Argentina; parts of China / Middle east; geographic risk and resistance trends change over time.}

Approximate malaria risk (1 month stay without chemoprophylaxis): (source: CCDR 2000 Malaria Recommendations, p.3)

-	Oceania (Papua New Guinea, Irian Jaya, Solomon Islands, and Vanuatu)	1:30 or higher
-	Sub-Saharan Africa	1:50
-	Indian Subcontinent	1:250
-	Southeast Asia	1:1000
-	South America	1:2,500
-	Central America	1:10,000

- Risk also ↑'d with >6month stay, in part due to underuse of protection measures.
- Stand-By Emergency Treatment (self-admin) may be recommended in select cases.

Hydroxychloroquine PLAQUENIL,g 200mg tab

{Not used very often! Licensed for malaria in USA**}**

Second-line: chloroquine sensitive malaria

PL

- Only in chloroquine-sensitive P. *falciparum* malaria prevention

{Opthalmological exam periodically if used weekly low dose long term; risk very low in first 5yrs; if >5yrs (BMJ,CDC), or high risk (ACP)}.

Pediatric: 5 mg base/kg weekly (200 mg tab = 155 mg base) (Do not exceed adult dose)

- Adult: 400 mg **weekly**
- Begin **2 wks prior** to entering MRZ, continue during stay & **8 wks after** leaving MRZ

19

- **Caution**: pts with hepatic failure, **G6PD** deficiency, pre-existing auditory damage; psoriasis, prophyria {Pregnancy: considered safe} {May have lower retinal risk than chloroquine.}
- SE: N/V/D(↓ by giving with food or milk), pruritus, fatigue, seizures, headache & dizziness. Uncommon: alopecia, hair depigmentation, skin eruptions & seizures.
- DI: antacids, cimetidine, digoxin (increase dig level)
- Vaccine Interaction[17]: Assume same as chloroquine

Abba K, Deeks JJ, Olliaro P, et al. **Rapid diagnostic tests** for diagnosing uncomplicated *P. falciparum* malaria in endemic countries. *Cochrane Database of Systematic Reviews* 2011, Issue 7. Art. No.: CD008122. DOI: 10.1002/14651858.CD008122.pub2. The sensitivity and specificity of all RDTs is such that they can replace or extend the access of diagnostic services to effective treatment and so is not useful for detecting treatment failures. HRP-2 antibody types may be more sensitive but are less specific than pLDH antibody-based tests, but the differences are small. The HRP-2 antigen persists even after effective treatment and so is not useful for detecting treatment failures.

Chen LH, Wilson ME, Schlagenhauf P. Controversies and misconceptions in malaria **chemoprophylaxis** for travelers. JAMA. 2007 May 23;297(20):2251-63. Despite widespread reports on the adverse effects of mefloquine, controlled studies found that serious neuropsychiatric adverse events occur at rates comparable with or lower than other chemoprophylaxis drugs. Moreover, mefloquine does not appear to impair performance while driving, flying, or diving. Vivax malaria causes significant illness in travelers, but current first-line chemoprophylaxis agents do not prevent relapses of vivax malaria. Although not licensed in most countries as primary prophylaxis, primaquine effectively prevents relapses of vivax malaria.

FDA June /09 approved safety labeling revisions for chloroquine phosphate tablets (Aralen, sanofi-aventis US) to warn of the potential for serious adverse events in **nursing infants**. According to the FDA, a decision should be made whether to discontinue therapy or stop nursing, taking into account the potential clinical benefit of the drug to the mother. In a study of 11 lactating mothers, the maximum daily dose of the drug received by the breast-feeding infant was about 0.7% of the maternal start dose (600 mg base) in malaria chemotherapy. Separate chemoprophylaxis for the infant is required.

Gogtay N, Kannan S, Thatte UM, et al. **Artemisinin-based combination therapy** for treating uncomplicated Plasmodium vivax malaria. Cochrane Database Syst Rev. 2013 Oct 25;10:CD008492. doi: 10.1002/14651858.CD008492.pub3. ACTs appear at least equivalent to chloroquine at effectively treating the blood stage of P. vivax infection. Even in areas where chloroquine remains effective, this finding may allow for simplified protocols for treating all forms of malaria with ACTs. In areas where chloroquine no longer cures the infection, ACTs offer an effective alternative.Dihydroartemisinin-piperaquine is the most studied ACT. It may provide a longer period of post-treatment prophylaxis than artemether-lumefantrine or artesunate plus amodiaquine. This effect may be clinically important in high transmission settings whether primaquine is also given or not.

Plant based **insect repellent and insecticide treated bed nets** to protect against malaria in areas of early evening biting vectors: double blind randomised placebo controlled clinical trial in the Bolivian Amazon. BMJ. 2007 Nov 17;335(7628):1023. Epub 2007 Oct 16. Insect repellents can provide protection against malaria. In areas where vectors feed in the early evening, effectiveness of treated nets can be significantly increased by using repellent between dusk and bedtime. This has important implications in malaria vector control programmes outside Africa and shows that the combined use of treated nets and insect repellents, as advocated for most tourists travelling to high risk areas, is fully justified.

DOI: 10.1002/14651858.CD009527.pub2. Home- or community-based interventions which provide antimalarial drugs free of charge probably improve prompt access to antimalarials, and there is moderate quality evidence from rural Ethiopia that they may impact on childhood mortality when implemented in appropriate settings. Programmes which treat all fevers presumptively with antimalarials lead to overuse antimalarials, and potentially undertreat other causes of fever such as pneumonia. Incorporating RDT diagnosis into home- or community-based programmes formalariamay help to reduce this overuse of antimalarials, and has been shown to be safe under trial conditions.

Art. No.: CD010927. DOI:10.1002/14651858.CD010927. In Africa, dihydroartemisinin-piperaquine reduces overall treatment failure compared to artemether-lumefantrine, although both drugs have PCR-adjusted failure rates of less than 5%. In Asia, dihydroartemisinin-piperaquine is as effective as artesunate plus mefloquine, and is better tolerated.

Linking antibiotic administration within 4 h of hospital admission (as a quality indicator) to financial compensation may result in an inaccurate diagnosis of CAP, inappropriate utilization of antibiotics, and thus less than optimal care.)
11. Mills GD, Oehley MR, Arrol B. Effectiveness of {beta} lactam antibiotics compared with antibiotics active against atypical pathogens in non-severe community acquired pneumonia: meta-analysis. BMJ 2005; 330:456-60. (InfoPOEMs: Strange, but true: Oral beta-lactam antibiotics -- amoxicillin, amoxicillin/clavulanate (Augmentin), or a cephalosporin -- are as effective in the treatment of community-acquired pneumonia as antibiotics active against atypical pathogens, even in patients infected with Mycoplasma pneumoniae or Chlamydia pneumoniae. These old standbys can be used instead of the more expensive drugs for most patients. Legionella infection still requires treatment with an antibiotic effective against atypical pathogens, but in these studies only 1.1% of the patients with nonsevere pneumonia had Legionella. These results are backed up by similar findings from clinical practice (Hedlund J, et al. Scand J Infect Dis 2002; 34:887-92). (LOE = 1a))

Epub 2005 Nov 9. Penicillin non-susceptibility rates were stable over the study period; overall, 21.8% of isolates were resistant. Azithromycin resistance increased from 31.0% in Year 1 to 36.3% in Year 4. Resistance rates for penicillin and azithromycin varied between countries and were highest in France, Spain, South Africa, USA and the Far East. Multidrug resistance in S. pneumoniae did not change significantly over the 4 years, with an overall rate of 38.6%. Telithromycin retained good activity against S. pneumoniae (0.1% of isolates resistant), including multidrug-resistant isolates.

112. Mulholland S, Gavranich JB, Chang AB. Antibiotics for community-acquired lower respiratory tract infections secondary to **Mycoplasma pneumoniae in children**. Cochrane Database Syst Rev. 2010 Jul 7;7:CD004875. There is insufficient evidence to draw any specific conclusions about the efficacy of antibiotics for this condition in children (although one trial suggests macrolides may be efficacious in some children with LRTI secondary to Mycoplasma). The use of antibiotics has to be balanced with possible adverse events. There is still a need for high quality, double-blinded RCTs to assess the efficacy and safety of antibiotics for LRTI secondary to M. pneumoniae in children.

165. Pugh R, Grant C, Cooke RP, et al. **Short-course** versus prolonged-course antibiotic therapy for hospital-acquired pneumonia in critically ill adults. Cochrane Database Syst Rev. 2011;(10): CD007577. We conclude that for patients with VAP not due to NF-GNB, a short fixed-course (seven or eight days) antibiotic therapy may be more appropriate than a prolonged course (10 to 15 days). Use of an individualised strategy (incorporating clinical features or serum procalcitonin) appears to safely reduce duration of antibiotic therapy for VAP.

Syst Rev. 2012 Sep 12;9:CD004418. No benefit of survival or clinical efficacy was shown with empirical atypical coverage in hospitalized patients with CAP. This conclusion relates mostly to the comparison of quinolone monotherapy to beta-lactams. Further trials, comparing beta-lactam monotherapy to the same combined with a macrolide, should be performed.

Craig JC, Simpson JM, Williams GJ, et al. **Prevention of Recurrent** Urinary Tract Infection in **Children** with **Vesicoureteric Reflux** and Normal Renal Tracts (**PRIVENT**) Investigators. Antibiotic prophylaxis and recurrent urinary tract infection in children. N Engl J Med. 2009 Oct 29;361(18):1748-59. Antibiotic prophylaxis reduces the likelihood of subsequent urinary tract infection (UTI; number needed to treat [NNT] = 16 for 1 year). However, subsequent infections are more likely to be caused by resistant organisms, and prophylaxis is not effective if the index infection was caused by a resistant organism. (LOE = 1b)

Fitzgerald A, Mori R, Lakhanpaul M, et al. Antibiotics for treating **lower urinary tract infection in children**. Cochrane Database Syst Rev. 2012 Aug 15;8:CD006857. Although antibiotic treatment is effective for children with UTI, there are insufficient data to answer the question of which type of antibiotic or which duration is most effective to treat symptomatic lower UTI. This review found that 10-day antibiotic treatment is more likely to eliminate bacteria from the urine than single-dose treatments. No differences were observed for persistent bacteriuria, recurrence or re-infection between short and long-course antibiotics where the antibiotic differed between groups. This data adds to an existing Cochrane review comparing short and long-course treatment of the same antibiotic who also reported no evidence of difference between short and long-course antibiotics.

Fourcroy JL, et al. Efficacy and safety of a novel once-daily extended-release ciprofloxacin tablet formulation for treatment of uncomplicated urinary tract infection in women. Antimicrob Agents Chemother. 2005 Oct;49(10):4137-43. (InfoPOEMs: A single dose of an extended-release version of ciprofloxacin (Cipro XR) is as effective as the immediate-release version taken twice daily for 3 days. The tiny reduction in the likelihood of gastrointestinal adverse effects (number needed to treat (NNT) = 60 - 80) is likely to be heavily promoted, and must be balanced against the higher cost of this formulation. As we are given more such options, it is important to remember the key elements in choosing a drug: its safety, tolerability, efficacy, price, and simplicity. Although extended-release ciprofloxacin is simpler, it is no more effective and will almost certainly cost more. (LOE = 1b))

Jepson RG, Craig JC. **Cranberries** for preventing urinary tract infections. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD001321. There is some evidence that cranberry juice may decrease the number of symptomatic UTIs over a 12 month period, particularly for women with recurrent UTIs. It's effectiveness for other groups is less certain. The large number of dropouts/withdrawals indicates that cranberry juice may not be acceptable over long periods of time. It is not clear what is the optimum dosage or method of administration (e.g. juice, tablets or capsules).
Jepson RG, Williams G, Craig JC. **Cranberries** for preventing urinary tract infections. Cochrane Database Syst Rev **2012**;(10):CD001321. Prior to the current update it appeared there was some evidence that cranberry juice may decrease the number of symptomatic UTIs over a 12 month period, particularly for women with recurrent UTIs. The addition of 14 further studies suggests that cranberry juice is less effective than previously indicated. Although some of small studies demonstrated a small benefit for women with recurrent UTIs, there were no statistically significant differences when the results of a much larger study were included.

Kahlmeter G, Poulsen HO. Antimicrobial susceptibility of **Escherichia coli** from community-acquired urinary tract infections in **Europe**: the ECO·SENS study revisited. Int J Antimicrob Agents. 2011 Nov 2. In E. coli, resistance to mecillinam, cefadroxil (representing oral cephalosporins), nitrofurantoin, fosfomycin trometamol, gentamicin and the third-generation cephalosporins cefotaxime and ceftazidime was<2%, with the following exceptions: gentamicin in Portugal (2.8%); fosfomycin in Greece (2.9%); and cephalosporins in Austria (2.7-4.1%). Resistance levels were higher for amoxicillin/clavulanic acid (2.0-8.9%) and ciprofloxacin (0.5-7.6%) and much higher to ampicillin (21.2-34.0%), sulfamethoxazole (21.2- 31.3%), trimethoprim (14.9-19.1%) and trimethoprim/sulfamethoxazole (14.4-18.2%). Resistance to quinolones and trimethoprim increased between the ECO·SENS I (1999-2000) and ECO·SENS II (2007-2008): nalidixic acid 4.3% to 10.2%; ciprofloxacin 1.1% to 3.9%; and trimethoprim 13.3% to 16.7%. In the previous study, no isolates with extended-spectrum β-lactamase were found; however, in the present study 11 isolates were identified as having either CTX-M or AmpC.

Kallen AJ, et al. Current antibiotic therapy for isolated urinary tract infections in women. Arch Intern Med. 2006 Mar 27;166(6):635-9. CONCLUSIONS: Quinolones have surpassed sulfas as the most common class of antibiotic prescribed for isolated outpatient UTI in women. Few significant predictors of quinolone use exist, suggesting that the increase is not confined to a certain subset of patients. This pervasive growth in quinolone use raises concerns about increases in resistance to this important class of antibiotics.

Nagler EV, Williams G, Hodson EM, et al. **Interventions for primary vesicoureteric reflux.** Cochrane Database Syst Rev. 2011 Jun 15;6:CD001532. Compared with no treatment, use of long-term, low-dose antibiotics did not significantly reduce the number of repeat symptomatic and febrile UTIs in children with VUR. Considerable heterogeneity in the analyses and inclusion of only one adequately blinded study, made drawing firm conclusions challenging. Antibiotic prophylaxis significantly reduced the risk of developing new or progressive renal damage, but assuming an 8% baseline risk, 33 children would need long-term antibiotic prophylaxis to prevent one more child developing kidney damage over the course of two to three years.The added benefit of surgical or endoscopic correction of VUR over antibiotic treatment alone remains unclear. Eight children would require combined surgical and antibiotic

treatment to prevent one additional child developing febrile UTI by five years, but it would not cause fewer children developing renal damage.

DOI: 10.1002/14651858.CD003237.pub2. {Cochrane Summary: Severe urinary tract infection (UTI) is a common infection in adults and children, causing acute disease with a variety of symptoms such as fever and flank pain. This may lead to kidney damage, kidney failure or hypertension. Standard therapy involves antibiotics given at least initially by injection. This review identified 15 studies (1743 participants). The results of this review suggest oral therapy is equally effective in treating UTI and preventing long-term damage. This might reduce costs but also inconvenience for the patient.}
Richards D, Toop L, Chambers S, Fletcher L. Response to antibiotics of women with symptoms of urinary tract infection but negative dipstick urine test results: double blind randomised controlled trial. BMJ 2005; 331:143-46. (InfoPOEMs: No infection, no antibiotic, right? Maybe not. In women with dysuria and frequency but a negative urine dipstick result for nitrites and leukocytes, 3 of 4 women will respond to antibiotic treatment as compared with 1 of 4 taking placebo. The negative dipstick result correlated with culture 92% of the time. These results imply that some women have microbial infections that are not identified by dipstick or culture. Or, perhaps, the antibiotic is doing something other than killing bacteria. (LOE = 1b))

Williams G, Craig JC. **Long-term antibiotics for preventing recurrent urinary tract infection in children.** Cochrane Database Syst Rev. 2011 Mar 16;3:CD001534. Long-term antibiotics appear to reduce the risk of repeat symptomatic UTI in susceptible children but the benefit is small and must be considered together with the increased risk of microbial resistance.

Wing DA, Rumney PJ, Preslicka CW, Chung JH. Daily **Cranberry Juice** for the Prevention of Asymptomatic Bacteriuria in Pregnancy: A Randomized, Controlled Pilot Study. J Urol. 2008 Aug 14. n=188 These data suggest there may be a protective effect of cranberry ingestion against asymptomatic bacteriuria and symptomatic urinary tract infections in pregnancy. Further studies are planned to evaluate this effect.

Zalmanovici Trestioreanu A, Green H, Paul M, et al. Antimicrobial agents for treating **uncomplicated urinary tract infection in women**. Cochrane Database Syst Rev. 2010 Oct 6;10:CD007182. No differences were observed between the classes of antimicrobials included in this review for the symptomatic cure of acute uncomplicated UTI. Fluoroquinolones proved more effective than beta-lactams for the short-term bacteriological outcome, probably with little clinical significance. Individualised treatment should take into consideration the predictable susceptibility of urinary pathogens in local areas, possible adverse events and resistance development, and patient preference.

Treatment of Low Back Pain [21, 22]

Red Flags (assessment considerations):

- pain when recumbent
- saddle anesthesia
- pseudoclaudication
- age >55y or <20
- recent UTI
- trauma (major
- pain persisting >1mo

Tx Guidelines:

- symptomatic relief can be accomplished with OTC medication and/or spinal manipulation
- during acute phase, bed rest >4 days may further debilitate the patient
- low-stress aerobic activity & exercise OK in first 2 weeks; may delay trunk muscle exercises
- recommend return to work/normal activities as soon as possible
- if problems persist, reassessment required
- address nonphysical factors (psych/socioeconomic)

Meds: acetaminophen 1st line; NSAIDs option if necessary & not contraindicated; strong opioids may be necessary for some but consider addiction risk, use treatment agreement and set appropriate boundaries; consider referral.

Back Pain Treatment Options: REFERENCES

Roelofs PD, Bierma-Zeinstra SM, van Poppel MN, et al. Lumbar supports to prevent recurrent low back pain among home care workers: a randomized trial. Ann Intern Med. 2007 Nov

0;147(10):685-92. Summary for patients in: Ann Intern Med. 2007 Nov 20;147(10):I54. {InfoPOEMs Jan07: A lumbar support belt used by people doing moderately strenuous activity who identify themselves as having back pain decreases the number of days they have pain. However, the overall number of days lost from work is not affected. (LOE = 1b-)}

[12] Cherkin D, Sherman K, et al. A Review of the Evidence for the effectiveness, safety & cost of acupuncture, message thereapy & spinal manipulation for back pain. Ann Intern Med 2003;138:898-906.

[13] Manheimer E, White A, et al. Meta-analysis: **Acupuncture** for low back pain. Ann Intern Med 2005; 142:651-63. (InfoPOEMs: Acupuncture is an effective treatment for decreasing pain in pts with chronic low back pain. It doesn't seem to be a placebo effect; acupuncture produces a significantly greater effect on pain than sham acupuncture. There is not enough research to allow a conclusion for the treatment of acute low back pain. (LOE = 1a)). Thomas KJ, et al. Randomised controlled trial of a short course of traditional acupuncture compared with usual care for persistent non-specific low back pain. BMJ. 2006 Sep 15; [Epub ahead of print] Weak evidence was found of an effect of acupuncture on persistent non-specific low back pain at 12 months, but stronger evidence of a small benefit at 24 months. Referral to a qualified traditional acupuncturist for a short course of treatment seems safe and acceptable to patients with low back pain. (Haake M, Muller HH, Schade-Brittinger C, Basler HD, Schafer H, Maier C, Endres HG, Trampisch HJ, Molsberger A. German Acupuncture Trials (GERAC) for Chronic Low Back Pain: Randomized, Multicenter, Blinded, Parallel-Group Trial With 3 Groups. Arch Intern Med. 2007 Sep 24;167(17):1892-8. Low back pain improved after acupuncture treatment for at least 6 months. Effectiveness of acupuncture, either verum or sham, was almost twice that of conventional therapy.)

Chou R, Huffman LH; American Pain Society; American College of Physicians. **Medications for acute and chronic low back pain**: a review of the evidence for an American Pain Society/American College of Physicians clinical practice guideline. Ann Intern Med. **2007** Oct 2;147(7):505-14. Medications with good evidence of short-term effectiveness for low back pain are NSAIDs, acetaminophen, skeletal muscle relaxants (for acute low back pain), and tricyclic antidepressants (for chronic low back pain). Evidence is insufficient to identify one medication as offering a clear overall net advantage because of complex tradeoffs between benefits and harms. Individual patients are likely to differ in how they weigh potential benefits, harms, and costs of various medications.

Chou R, Huffman LH; American Pain Society; American College of Physicians. **Nonpharmacologic therapies for acute and chronic low back pain**: review of the evidence for an American Pain Society/American College of Physicians clinical practice guideline. Ann Intern Med. **2007** Oct 2;147(7):492-504. Therapies with good evidence of moderate efficacy for chronic or subacute low back pain are cognitive-behavioral therapy, exercise, spinal manipulation, and interdisciplinary rehabilitation. For acute low back pain, the only therapy with good evidence of efficacy is superficial heat.

Chou R, Qaseem A, Snow V, Casey D, Cross JT Jr, Shekelle P, Owens DK; Clinical Efficacy Assessment Subcommittee of the American College of Physicians; American College of Physicians; American Pain Society Low Back Pain Guidelines Panel. **Diagnosis and treatment of low back pain**: a joint clinical practice guideline from the American College of Physicians and the American Pain Society. Ann Intern Med. **2007** Oct 2;147(7):478-91. 1: Clinicians should conduct a focused history and physical examination to help place patients with low back pain into 1 of 3 broad categories: nonspecific low back pain, back pain potentially associated with radiculopathy or spinal stenosis, or back pain potentially associated with another specific spinal cause. The history should include assessment of psychosocial risk factors, which predict risk for chronic disabling back pain (strong recommendation, moderate-quality evidence). RECOMMENDATION 2: Clinicians should not routinely obtain imaging or other diagnostic tests in patients with nonspecific low back pain (strong recommendation, moderate-quality evidence). RECOMMENDATION 3: Clinicians should perform diagnostic imaging and testing for patients with low back pain when severe or progressive neurologic deficits are present or when serious underlying conditions are suspected on the basis of history and physical examination (strong recommendation, moderate-quality evidence). RECOMMENDATION 4: Clinicians should evaluate patients with persistent low back pain and signs or symptoms of radiculopathy or spinal stenosis with magnetic resonance imaging (preferred) or computed tomography only if they are potential candidates for surgery or epidural steroid injection (for suspected radiculopathy) (strong recommendation, moderate-quality evidence). RECOMMENDATION 5: Clinicians should provide patients with evidence-based information on low back pain with regard to their expected course, advise patients to remain active, and provide information about effective self-care options (strong recommendation, moderate-quality evidence). RECOMMENDATION 6: For patients with low back pain, clinicians should consider the use of medications with proven benefits in conjunction with back care information and self-care. Clinicians should assess severity of baseline pain and functional deficits, potential benefits, risks, and relative lack of long-term efficacy and safety data before initiating therapy (strong recommendation, moderate-quality evidence). For most patients, first-line medication options are acetaminophen or nonsteroidal anti-inflammatory drugs. RECOMMENDATION 7: For patients who do not improve with self-care options, clinicians should consider the addition of nonpharmacologic therapy with proven benefits-for acute low back pain, spinal manipulation; for chronic or subacute low back pain, intensive interdisciplinary rehabilitation, exercise therapy, acupuncture, massage therapy, spinal manipulation, yoga, cognitive-behavioral therapy, or progressive relaxation (weak recommendation, moderate-quality evidence).

Chou R, Atlas SJ, Stanos SP, Rosenquist RW. **Nonsurgical interventional therapies for low back pain**: a review of the evidence for an American Pain Society clinical practice guideline. *Spine (Phila Pa 1976)*. 2009;34(10):1078-1093.

Chou R, Fu R, Carrino JA, Deyo RA. **Imaging strategies** for low-back pain: systematic review and meta-analysis. Lancet. 2009 Feb 7;373(9662):463-72. Lumbar imaging for low-back pain without indications of serious underlying conditions does not improve clinical outcomes. Therefore, clinicians should refrain from routine, immediate lumbar imaging in patients with acute or subacute low-back pain and without features suggesting a serious underlying condition.

Chou R, Loeser JD, Owens DK,; American Pain Society (APS) Low Back Pain Guideline Panel. **Interventional therapies, surgery, and interdisciplinary rehabilitation** for low back pain: an evidence-based clinical practice guideline from the American Pain Society. Spine. 2009 May 1;34(10):1066-77. In patients with nonradicular pain: Interdisciplinary rehabilitation emphasizing cognitive-behavioral approaches should be considered for those who don't respond to usual interventions; Provocative discography (injecting material into a disc nucleus in an attempt to reproduce the patient's typical pain) is not recommended; Facet joint corticosteroid injection, prolotherapy (repeated injections of irritant material to stimulate an inflammatory response), and intradiscal corticosteroid injection are not recommended; Persistent disabling symptoms and degenerative spinal changes should prompt discussion and shared decision-making regarding surgery or interdisciplinary rehabilitation (there is insufficient evidence to weigh the use of vertebral disc replacement in these patients. In patients with persistent radiculopathy: Those with herniated discs should be offered discussion about the use of epidural steroid injection; Those with herniated discs and disabling leg pain from spinal stenosis should be offered discussion about surgery; Those with persistent pain after surgery should be offered discussion on the risks and benefits of spinal cord stimulation.

Chou R, Shekelle P. Will this patient develop persistent **disabling low back pain**?. JAMA. 2010 Apr 7;303(13):1295-302.

Chou Roger, Qaseem Amir, Owens Douglas K., et al. and for the Clinical Guidelines Committee of the American College of Physicians. **Diagnostic Imaging for Low Back Pain**: Advice for High-Value Health Care From the American College of Physicians. *Ann Intern Med* February 1, **2011** 154:181-189. Use an initial trial of therapy rather than immediate imaging. However, imaging is warranted when the patient has major risk factors for cancer, or shows severe or progressive neurologic deficits. Risk factors or signs of vertebral infection or the cauda equina syndrome, although rare, also warrant more immediate imaging.

Clarke J, van Tulder M, Blomberg S, et al. Traction for low-back pain with or without sciatica. Cochrane Database Syst Rev. 2005 Oct 19;4:CD003010. AUTHORS' CONCLUSIONS: The evidence suggests that traction is probably not effective.Neither continuous nor intermittent traction by itself was more effective in improving pain, disability or work absence than placebo, sham or other treatments for patients with a mixed duration of LBP, with or without sciatica. Although trials studying patients with sciatica had methodological limitations and inconsistent results, there was moderate evidence that autotraction was more effective than mechanical traction for global improvement in this population.

Dahm KT, Brurberg KG, Jamtvedt G, Hagen KB. Advice to rest in bed versus advice to stay active for acute low-back pain and sciatica. Cochrane Database Syst Rev. 2010 Jun 16;6:CD007612. Moderate quality evidence shows that patients with acute LBP may experience small benefits in pain relief and functional improvement from advice to stay active compared to advice to rest in bed; patients with sciatica experience little or no difference between the two approaches. Low quality evidence suggests little or no difference between those who received advice to stay active, exercises or physiotherapy. Further research is very likely to have an important impact on the estimate of effect and is likely to change our confidence in it.

randomised controlled trial. Lancet. 2007 Nov 10;370(9599):1638-1643. Patients with acute low back pain receiving recommended first-line care do not recover more quickly with the addition of diclofenac or spinal manipulative therapy.

Hellum C, Johnsen LG, Storheim K, et al. **Surgery with disc prosthesis versus rehabilitation** in patients with low back pain and degenerative disc: two year follow-up of randomised study. BMJ 2011;342:d2786.

Henschke N, Ostelo RWJG, van Tulder MW, et al. **Behavioural treatment** for chronic low-back pain. Cochrane Database of Systematic Reviews 2010, Issue 7. Art. No.: CD002014. For patients with CLBP, there is moderate quality evidence that in the short-term, operant therapy is more effective than waiting list and behavioural therapy is more effective than usual care for pain relief, but no specific type of behavioural therapy is more effective than another. In the intermediate- to long-term, there is little or no difference between behavioural therapy and group exercises for pain or depressive symptoms. Further research is likely to have an important impact on our confidence in the estimates of effect and may change the estimates.

Henschke N, Maher CG, Ostelo RWJG, de Vet HCW, Macaskill P, Irwig L. **Red flags** to screen for malignancy in patients with low-back pain. Cochrane Database of Systematic Reviews 2013, Issue 2. Art. No.: CD008686. DOI:10.1002/14651858.CD008686.pub2. For most "red flags," there is insufficient evidence to provide recommendations regarding their diagnostic accuracy or usefulness for detecting spinal malignancy. The available evidence indicates that in patients with LBP, an indication of spinal malignancy should not be based on the results of one single "red flag" question. Further research to evaluate the performance of different combinations of tests is recommended.

Naumann M, So Y, Argoff CE, Childers MK, Dykstra DD, Gronseth GS, Jabbari B, Kaufmann HC, Schurch B, Silberstein SD, Simpson DM; Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Assessment: **Botulinum** neurotoxin in the treatment of autonomic disorders and pain (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 May 6;70(19):1707-14. Botulinum neurotoxin (BoNT) should be offered as a treatment option for the treatment of axillary hyperhidrosis and detrusor overactivity (Level A), should be considered for palmar hyperhidrosis, drooling, and detrusor sphincter dyssynergia after spinal cord injury (Level B), and may be considered for gustatory sweating and low back pain (Level C). BoNT is probably ineffective in episodic migraine and chronic tension-type headache (Level B). There is presently no consistent or strong evidence to permit drawing conclusions on the efficacy of BoNT in chronic daily headache (mainly transformed migraine) (Level U). While clinicians' practice may suggest stronger recommendations in some of these indications, evidence-based conclusions are limited by the availability of data.

Ribeiro LH, Furtado RN, Konai MS, et al. Effect of **facet joint injection** versus **systemic steroids** in low back pain: a randomized controlled trial. Spine (Phila Pa 1976). 2013 Nov 1;38(23):1995-2002.

Rodríguez-Oviedo P, Ruano-Ravina A, Pérez-Ríos M, et al. School **children's backpacks**, back pain and back pathologies. Arch Dis Child. 2012 Mar 10.

Roelofs PD, Deyo RA, Koes BW, Scholten RJ, van Tulder MW. Nonsteroidal anti-inflammatory drugs for low back pain: an updated cochrane review. Spine. 2008 Jul 15;33(16):1766-74. The evidence from the 65 trials included in this review suggests that NSAIDs are effective for short-term symptomatic relief in patients with acute and chronic low back pain without sciatica. However, effect sizes are small. Furthermore, there does not seem to be a specific type of NSAID, which is clearly more effective than others. The selective COX-2 inhibitors showed fewer side effects compared with traditional NSAIDs in the randomized controlled trials included in this review. However, recent studies have shown that COX-2 inhibitors are associated with increased cardiovascular risks in specific patient populations.

Rubinstein SM, van Middelkoop M, Assendelft WJJ, de Boer MR, van Tulder MW. **Spinal manipulative therapy** for chronic low-back pain. *Cochrane Database of Systematic Reviews* 2011, Issue 2. Art. No.: CD008112. DOI: 10.1002/14651858.CD008112.pub2. High quality evidence suggests that there is no clinically relevant difference between SMT and other interventions for reducing pain and improving function in patients with chronic low-back pain. Determining cost-effectiveness of care has high priority.

Rubinstein SM, Terwee CB, Assendelft WJJ, de Boer MR, van Tulder MW. **Spinal manipulative therapy** for acute low-back pain. Cochrane Database of Systematic Reviews 2012, Issue 9. Art. No.: CD008880. DOI: 10.1002/14651858.CD008880.pub2. SMT is no more effective in participants with acute low-back pain than inert interventions, sham SMT, or when added to another intervention. SMT also appears to be no better than other recommended therapies.

Santilli V, Beghi E, Finucci S. Chiropractic manipulation in the treatment of acute back pain and sciatica with disc protrusion: a randomized double-blind clinical trial of active and simulated spinal manipulations. Spine J. 2006 Mar-Apr;6(2):131-7. Epub 2006 Feb 3.

Urquhart D, et al. **Antidepressants** for non-specific **low back pain**. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD001703. There is no clear evidence that antidepressants are more effective than placebo in the management of patients with chronic low-back pain.

van Wijk RM, Geurts JW, Wynne HJ, et al. Radiofrequency denervation of lumbar facet joints in the treatment of chronic low back pain: a randomized, double-blind, sham lesion-controlled trial. Clin J Pain. 2005 Jul-Aug;21(4):335-44.

Verbeek JH, Martimo KP, Karppinen J, et al. **Manual material handling advice and assistive devices for preventing and treating back pain in workers.** Cochrane Database Syst Rev. 2011 Jun 15;6:CD005958. There is moderate quality evidence that MMH advice and training with or without assistive devices does not prevent back pain or back pain-related disability when compared to no intervention or alternative interventions. There is no evidence available from RCTs for the effectiveness of MMH advice and training or MMH assistive devices for treating back pain.

Wang GS, Le Lait MC, Heard K. **Unintentional pediatric exposures** to central alpha-2 agonists (**clonidine**, guanfacine, tizanidine) reported to the national poison data system. J Pediatr. 2014 Jan;164(1):149-52.

Waseem Z, Boulias C, Gordon A, et al. **Botulinum toxin injections** (Botox) for low-back pain and sciatica. Cochrane Database Syst Rev. 2011 Jan 19;1:CD008257. We identified three studies that investigated the merits of BoNT for LBP, but only one had a low risk of bias and evaluated patients with non-specific LBP (N = 31).

Walker BF, French SD, Grant W, Green S. **Combined chiropractic interventions** for low-back pain. Cochrane Database of Systematic Reviews 2010, Issue 4. Art. No.: CD005427. Combined chiropractic interventions slightly improved pain and disability in the short-term and pain in the medium-term for acute and subacute LBP. However, there is currently no evidence that supports or refutes that these interventions provide a clinically meaningful difference for pain or disability in people with LBP when compared to other interventions. Future research is very likely to change the estimate of effect and our confidence in the results.

Walker BF, Hebert JJ, , et al. Outcomes of **usual chiropractic**. The **OUCH** randomized controlled trial of adverse events. Spine (Phila Pa 1976). 2013 Sep 15;38(20):1723-9.

Wegner I, Widyahening IS, van Tulder MW, et al. **Traction for low-back pain** with or without sciatica. Cochrane Database Syst Rev. 2013 Aug 19;8:CD003010. These findings indicate that traction, either alone or in combination with other treatments, has little or no impact on pain intensity, functional status, global improvement and return to work among people with LBP.

Extras:

- **Renal Failure** – Considerations: that need to alter approach to drug selection will depend on degree of renal dysfx (e.g. GFR ≥20ml/min, 10-20ml/min, <10ml/min), pain severity & drug dose required, use of dialysis.
  A) Less problematic options may include: acetaminophen, tramadol, topicals (capsaicin, nitro spray?); hydromorphone, fentanyl, methadone. {Always include non-drug techniques.}
- **Cisplatinin** related neuropathy: prevention with Vitamin E 400mg/day starting before, and going for 3 months after cisplatinin treatment.

Gronseth G, Cruccu G, Alksne J, et al. Practice Parameter: The diagnostic evaluation and treatment of trigeminal neuralgia (an evidence-based review). Report of the Quality Standards Subcommittee of the American Academy of Neurology and the European Federation of Neurological Societies. Neurology. 2008 Aug 20. [Epub ahead of print] In patients with trigeminal neuralgia (TN), routine head imaging identifies structural causes in up to 15% of patients and may be considered useful (Level C). Trigeminal sensory deficits, bilateral involvement of the trigeminal nerve, and abnormal trigeminal reflexes are associated with an increased risk of symptomatic TN (STN) and should be considered useful in distinguishing STN from classic trigeminal neuralgia (Level B). There is insufficient evidence to support or refute the usefulness of MRI to identify neurovascular compression of the trigeminal nerve (Level U). Carbamazepine (Level A) or oxcarbazepine (Level B) should be offered for pain control while baclofen and lamotrigine (Level C) may be considered useful. For patients with TN refractory to medical therapy, Gasserian ganglion percutaneous techniques, gamma knife, and microvascular decompression may be considered (Level C). The role of surgery vs pharmacotherapy in the management of TN in patients with MS remains uncertain. Based upon this review of the existing evidence, patients with trigeminal neuralgia should undergo trigeminal reflex testing and be given carbamazepine. Based on weaker evidence, patients with trigeminal neuralgia that is refractory to medical therapy are likely to benefit from surgery. (LOE = 2a-)
