Is Apixaban (Eliquis®) an Option for Your Patient?

Indications¹
- Non-Valvular Atrial Fibrillation (NVAF) to prevent stroke & systemic embolism
- Acute VTE treatment & prevention of recurrent VTE [for deep vein thrombosis (DVT) and pulmonary embolism (PE)]
- Prevention of venous thromboembolic events (VTE) in elective total hip or knee replacement surgery (THR, TKR)

*CCS definition: AF without mechanical heart valves, rheumatic mitral stenosis, or moderate/severe non-rheumatic mitral stenosis ²

Requirements¹ - NOTE: Apixaban accumulates in hepatic and/or renal dysfunction
- Stable creatinine clearance (CrCl) greater than 15 mL/min (see dosing recommendations)
- Stable liver function [refer to Contraindications and Limitations sections below]

Contraindications¹²
- Mechanical heart valves
- Apixaban, like other anticoagulants, is contraindicated in patients at high risk for bleeding
- Pregnant/Breastfeeding: Safety & dosing has not been studied. Use is NOT recommended
- Moderate to severe hepatic impairment associated with coagulopathy and clinically relevant bleeding risk. Patients with severe hepatic impairment or active hepatobiliary disease have not been studied.
- Drug Interactions: Significant drug interactions involving of both CYP 3A4 and P-glycoprotein - See below

Potential Limitations¹
- Not recommended in hemodynamically unstable acute PE or those requiring thrombectomy or thrombolysis
- Drug Interactions: AVOID rifampin, selectazole antifungals (e.g. ketoconazole,itraconazole but excluding fluconazole), select anticonvulsants (e.g. phenytoin, carbamazepine, phenobarbital), HIV protease inhibitors, St. John’sWort & other strong CYP 3A4/P-gp inducers and inhibitors as there is minimal knowledge of clinical outcomes
- Combination therapy with antiplatelets increases bleeding risk
- Rapid decline in anticoagulant effect after a missed dose; adherence is critical
- Very limited data with extremes of weight (under 50 kg; over 120 kg or BMI > 40)³
- Less than 18 years of age: Safety & dosing has not been established
- Patients with ALT & AST greater than 2x ULN or total bilirubin greater than 1.5x ULN were excluded in clinical trials

May offer an advantage over warfarin if:
- Difficulty stabilizing on warfarin for reasons other than poor medication adherence
- INR monitoring is problematic (e.g. poor venous access, frequent travel, remote location). NOTE: Use of warfarin with point-of-care (POC) INR testing (e.g. Coaguchek XS™) may be an alternative solution
- AF: Superior reduction in rate of all-cause stroke and systemic embolism, lower rate of major bleeding, clinically relevant minor bleeding and hemorrhagic stroke compared to warfarin⁴

Dosing Recommendations¹*

<table>
<thead>
<tr>
<th>Stroke Prevention in Non-Valvular Atrial Fibrillation**</th>
<th>5mg bid, or 2.5mg bid if TWQ or more of:</th>
<th>CrCl Less than 25 mL/min:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Scr 133 µmol/L or greater</td>
<td>15-24 mL/min: use caution.</td>
</tr>
<tr>
<td></td>
<td>• 80 years or older</td>
<td>(No dosing recommendation)</td>
</tr>
<tr>
<td></td>
<td>• 60kg or less</td>
<td>&lt; 15 mL/min: Avoid Use</td>
</tr>
<tr>
<td>Acute DVT/PE Treatment</td>
<td>10 mg bid for 7 days, followed by 5 mg bid</td>
<td>CrCl Less than 30 mL/min:</td>
</tr>
<tr>
<td></td>
<td>After at least 6 months of treatment, recommended dose for continued prevention of recurrent DVT/PE is 2.5mg BID</td>
<td>15-29 mL/min: Usual dose, but use caution as higher bleeding risk.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt; 15 mL/min: Avoid Use</td>
</tr>
<tr>
<td>Hip &amp; Knee Replacement</td>
<td>2.5 mg bid x 10-14 days (TKR); x 32-38 days (THR)</td>
<td>ántological outcomes</td>
</tr>
</tbody>
</table>

* Oral use: May crush & mix with applesauce or suspend in 30mL water. NG tube: May crush and suspend in 60mL D5W.¹⁵
** Apixaban for atrial fibrillation may be used at usual doses in combination with P2Y12 inhibitor (clopidogrel) after ACS or PCI. ⁶

Inform Your Patient:
- Atrial Fibrillation: Should decrease risk of stroke by 2/3 compared to no anticoagulation
- Carry information indicating they are on an anticoagulant and inform their healthcare providers, including dentists
- Must be taken TWICE daily with or without food; adherence is essential to avoid treatment failure
- Venous Thromboembolism: Ensure clarity of dose change after initial 7 days
- Report symptoms/signs of bleeding, stroke, or DVT/PE
- Cost varies by drug plan coverage and/or provincial criteria
Monitoring Patients on Apixaban

- CrCl should be determined at baseline and at least annually. Monitor more frequently if older than 75y, with renal dysfunction (CrCl <60 mL/min), or when a decline in renal function suspected
- Monitor for symptoms and signs of bleeding
- No routine coagulation testing required. **NOTE**: INR is not useful for monitoring. Do not target INR 2 to 3. More specialized testing should only be considered in consultation with an expert in anticoagulation.

Switching Between Agents

From warfarin to apixaban:
- Discontinue warfarin and start apixaban once INR is less than 2

From non-warfarin anticoagulant (oral or parenteral - e.g. LMWH, rivaroxaban, dabigatran, edoxaban) to apixaban:
- Start apixaban at the time the next scheduled dose of the non-warfarin anticoagulant was to be administered
- For **prophylactic** dosing of parenteral anticoagulants, apixaban can be started 6 or more hours after the last dose
- For agents administered by continuous infusion, stop the infusion and start apixaban at the same time

From apixaban to warfarin:
- Start warfarin and only discontinue apixaban once INR is 2 or greater. **NOTE**: Apixaban may affect INR; therefore when starting warfarin, INR may initially be unreliable. If possible, checking INR just prior to next apixaban dose may better reflect the anticoagulant effect of warfarin.

From apixaban to non-warfarin anticoagulants (oral or parenteral): (e.g. LMWH, rivaroxaban, dabigatran, edoxaban)
- Discontinue apixaban and give the 1st dose of non-warfarin anticoagulant at the time the next dose of apixaban is due

Management of Bleeding Episodes with Apixaban

- Vitamin K, protamine, plasma and/or idarucizumab will **not** reverse drug effects
- In the event of major hemorrhagic complications, discontinue apixaban and refer patient for urgent assessment and locally developed management strategies
- Limited evidence demonstrates prothrombin complex concentrates (e.g. Octaplex®/Beriplex®) are able to reverse the anticoagulant effect\(^1\), but the effect of these agents on bleeding outcomes is limited.
- Specific antidotes are not yet available in Canada\(^8\)

Anticoagulation around Invasive Procedures\(^9\) (e.g. surgery, elective day procedures, major dental procedures)

- As with warfarin, very low risk bleed procedures (such as dental extraction) do not require withholding apixaban
- Management plans should be made in consultation with the provider performing the procedure
- Renal and hepatic function significantly impacts clearance of apixaban. If the recommendations below cannot be met, consultation with an expert in anticoagulation management is encouraged.
- Due to the onset/offset time of apixiban, peri-procedural use of LMWH is not required

**Pre-Procedure - If required, stop apixaban before procedure as follows:**

<table>
<thead>
<tr>
<th>Renal function* (CrCl mL/min)</th>
<th>Last intake of drug prior to procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Bleeding Risk</td>
<td>High Bleeding Risk*</td>
</tr>
<tr>
<td>30 or more</td>
<td>at least 24 hours</td>
</tr>
<tr>
<td>15 - 29</td>
<td>at least 36 hours</td>
</tr>
</tbody>
</table>

\(^*\) Make a careful decision (i.e. hold longer) for patients undergoing major surgery, spinal puncture, or other regional anaesthesia in whom complete hemostasis required. Consult specialist in these high risk patients/procedures.

For an interactive perioperative management algorithm, see Thrombosis Canada website: [http://thrombosiscanada.ca/?page_id=502&calc=perioperativeAnticoagulantAlgorithm](http://thrombosiscanada.ca/?page_id=502&calc=perioperativeAnticoagulantAlgorithm)

**Post Procedure:** Resumption should not be initiated until adequate hemostasis has been achieved and clinical situation allows (usually 1 - 3 days). **NOTE:** Full therapeutic effect occurs approximately 2 hours after ingestion.
