Over 12 weeks, prucalopride 2-4mg po daily x 12 weeks significantly improved bowel function and reduced the severity of symptoms in patients with severe chronic constipation. Larger and longer trials are required to further assess the risks and benefits of the use of prucalopride for chronic constipation.
32. Ford AC, Talley NJ, et al. Effect of fibre, antispasmodics, and peppermint oil in the treatment of irritable bowel syndrome: systematic review and meta-analysis. BMJ. 2008 Nov 13;337:a2313. doi: 10.1136/bmj.a2313. Fibre, antispasmodics, & peppermint oil were all more effective than placebo in treatment of irritable bowel syndrome. Fiber provides minimal likelihood of benefit in patients with irritable bowel syndrome (IBS). Antispasmodics, particularly scopolamine (hyoscine) and otilonium, are effective in 50% to 70% of patients. Peppermint oil is also effective, with approximately 75% of patients responding (number needed to treat = 2.5). (LOE = 1a-)

36. Ford AC, Talley NJ, Schoenfeld PS, Quigley EM, Moayyedi P. Efficacy of Antidepressants and Psychological Therapies in Irritable Bowel Syndrome: Systematic Review and Meta-analysis. Gut. 2008 Nov 10. [Epub ahead of print]
37. Zijdenbos IL, de Wit NJ, van der Heijden GJ, Rubin G, Quartero AO. Psychological treatments for the management of irritable bowel syndrome. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD006442. Psychological interventions may be slightly superior to usual care or waiting list control conditions at the end of treatment although the clinical significance of this is debatable. Except for a single study, these therapies are not superior to placebo and the sustainability of their effect is questionable. The meta-analysis was significantly limited by issues of validity, heterogeneity, small sample size and outcome definition. Future research should adhere to current recommendations for IBS treatment trials and should focus on the long-term effects of treatment.

Probiotics appear to be efficacious in IBS, but the magnitude of benefit and the most effective species and strain are uncertain.

61. Kaminski A, Kamper A, Thaler K, et al. Antidepressants for the treatment of abdominal pain-related functional gastrointestinal disorders in children and adolescents. Cochrane Database Syst Rev. 2011 Jul 6;7:CD008013. Clinicians must be aware that for the majority of antidepressant medications no evidence exists that supports their use for the treatment of abdominal pain-related FGIDs in children and adolescents. The existing randomised controlled evidence is limited to studies on amitriptyline and revealed no statistically significant differences between amitriptyline and placebo for most efficacy outcomes. Amitriptyline does not appear to provide any benefit for the treatment of FGIDs in children and adolescents.

There is no evidence that bulking agents are effective for treating IBS. There is evidence that antispasmodics are effective for the treatment of IBS. The individual subgroups which are effective include: cimetropium/dicyclomine, peppermint oil, pinaverium and trimebutine. There is good evidence that antidepressants are effective for the treatment of IBS. The subgroup analyses for SSRIs and TCAs are unequivocal and their effectiveness may depend on the individual patient.

Alhashimi D, Al-Hashimi H, Fedorowicz Z. Antiemetics for reducing vomiting related to acute gastroenteritis in children and adolescents. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD005506. The small number of included trials provided some limited evidence favouring the use of ondansetron and metoclopramide over placebo to reduce the number of episodes of vomiting due to gastroenteritis in children. The increased incidence of diarrhea with both ondansetron and metoclopramide was considered to be as a result of retention of fluids and toxins that would otherwise have been eliminated through the process of vomiting.

Fedorowicz Z, Jagannath VA, Carter B. Antiemetics for reducing vomiting related to acute gastroenteritis in children and adolescents. Cochrane Database of Systematic Reviews 2011, Issue 9. Art. No.: CD005506. DOI: 10.1002/14651858.CD005506.pub5. Oral ondansetron increased the proportion of patients who had ceased vomiting and reduced the number needing intravenous rehydration and immediate hospital admission. Intravenous ondansetron and metoclopramide reduced the number of episodes of vomiting and hospital admission, and dimenhydrinate as a suppository reduced the duration of vomiting.

FDA Warning regarding metoclopramide & tardive dyskinesia (Feb 2009): http://www.fda.gov/bbs/topics/NEWS/2009/NEW01963.html
FDA Sep/09 notified healthcare professionals that a Boxed Warning is being added to the prescribing information for Promethazine Hydrochloride products, describing the risks of severe tissue injury, including gangrene, requiring amputation following intravenous administration of promethazine.
FDA Dec/09 The Texas Department of State Health Services and FDA notified healthcare professionals and consumers, especially pregnant or breastfeeding women, to avoid consuming a product called "Nzu", taken as a traditional remedy for morning sickness,because of the potential health risks from high levels of lead and arsenic, noted on laboratory analysis by Texas DSHS. Nzu, which is sold at African specialty stores is also called Calabash clay, Calabar stone, Mabele, Argile and La Craie. It generally resembles balls of clay or mud and is usually sold in small plastic bags with a handwritten label identifying it as "Nzu" or "Salted Nzu."
FDA Dec/10 The injectable form of dolasetron mesylate (Anzemet) should not be used to prevent nausea or vomiting related to chemotherapy because the drug increases the risk for torsade de pointes. The FDA recommends against using Anzemet injections in patients with congenital long-QT syndrome. The warning does not apply to Anzemet tablets because the risks for developing an abnormal heart rhythm are not as high as with the injections. FDA MedWatch alert (Free)
FDA Sep/11 The U.S. Food and Drug Administration (FDA) is informing the public of an ongoing safety review of the anti-nausea drug Zofran (ondansetron, ondansetron hydrochloride and their generics). Ondansetron may increase the risk of developing abnormal changes(QT prolongation & torsades) in the electrical activity of the heart
Fujii Y, Itakura M. Comparison of propofol, droperidol, and metoclopramide for prophylaxis of postoperative nausea and vomiting after breast cancer surgery: a prospective, randomized, double-blind, placebo-controlled study in Japanese patients. Clin Ther. 2008 Nov;30(11):2024-9.

Health Canada May/11 ANZEMET (dolasetron mesylate) - Withdrawal of 20 mg/mL Intravenous Injection Due to Potential Risk of Arrhythmias. New data suggest that intravenous administration of the injectable form of ANZEMET (dolasetron mesylate) may result in serious arrhythmias.
Health Canada July/11 is informing health professionals and consumers that the labelling information for the drug metoclopramide is being updated to include stronger warnings on the risk of a movement disorder known as "tardive dyskinesia."
Health Canada Mar/12: Domperidone should be used at the lowest possible dose. The risk of serious ventricular arrhythmias (QT) and sudden cardiac death may be higher in patients taking daily doses greater than 30 mg, and in patients over 60 years old.

Cochrane Database of Systematic Reviews 2010, Issue 9. Art. No.: CD007786. DOI: 10.1002/14651858.CD007786.pub2. Our overall knowledge of themost effective antiemetics to prevent chemotherapy-induced nausea and vomiting in childhood is incomplete. This review suggests that 5-HT3 antagonists with dexamethasone added are effective in patients who are to receive highly emetogenic chemotherapy although the risk-benefit profile of additional steroid remains uncertain.

RA - EXTRAS

Approach & Considerations for Drug Tx in RA

- Initial: DMARD + NSAID +/- Corticosteroid for symptoms. MTX often the DMARD of choice, however, HCQ is safer but suitable only for mild cases.
  -NSAIDs now used primarily for bridging and pain management.
  -Oral corticosteroids associated with complications, so use controversial. Short courses &/or low doses for ≤2yrs sometimes used (↓ joint pain & systemic symptoms). Intra-articular injections useful & few AEs.
  -Earlier combo DMARD or biologic tx warranted for those with high disease activity & poor prognositic factors.
  {Features of poor prognosis include: functional limitation, extraarticular disease rheumatoid nodules, RA vasculitis, Felty's syndrome, +'ve rheumatoid factor, anti-cyclic citrullinated peptide antibodies, bony erosions radiographic.}
- TNF inhibitors - 1st line biologics after an inadequate response to a DMARD. They are given +/- MTX (synergistic). Note, infliximab given with MTX (not recommended for monotherapy).
  - Initial TNF inhibitor choice: varies with clinician (often etanercept rapid onset, short t ½ or infliximab)
  - Relative to other agents, TNF-inhibitors may be more effective in relieving symptoms & limiting joint destruction. They often also act more rapidly.
  - AEs: 1) Injection site reactions (back pain, fever, urticaria, dyspnea, ↓BP): common with etanercept, golimumab, certolizumab, & adalimumab.
    2) Cytopenia: uncommon, but can occur with any anti-TNF tx. Monitor CBC.
    3) The potential for Serious Infections: (eg. bacterial sepsis, TB reactivated & disseminated, fungal, viral & opportunistic unusual eg. *p. jiroveci*) are important; screen for active infection, latent TB, etc.
    4) Malignancies (esp. lymphomas): reported but causality not established. The condition of RA ↑ lymphoma risk on its own. Avoid anti-TNF tx in patients with recent ca.
    5) Other AEs: (rare) – CHF, reversible lupus-like syndrome, demyelinating conditions eg. M.S. (avoid if hx), hepatoxicity (caution with infliximab).
  - If 1st TNF inhibitor is not effective, switching to a 2nd TNF inhibitor may be effective; however, many specialists will opt for a non-TNF biologic for a different mechanism of action.
- Non-TNF Biologics – include rituximab co-admin with a DMARD; pre-treat to prevent infusion reaction, abatacept +/- a DMARD, tocilizumab may work in ≥2wks, AEs (many; severe complications reported), anakinra less effective.
- Aggressive early therapy with MTX &/or a biologic ⇨ longer remissions, less joint destruction & improved quality of life.
- Combination Tx with 2-3 DMARDs (or a DMARD + biologic): often more effective than monotherapy without more toxicity.
  - Triple DMARD Tx: MTX +SSZ + HCQ (+/- prednisone low-dose ≤7.5-10mg/day) effective. ◆MTX + Biologic more efficatious than either alone. ◆Combination of 2+ Biologics NOT recommended as ↑ toxicity!
- Comorbidity & biologics ACR RA 2012:
  - 1) Hepatitis: a) Hep C ⇨ potentially recommend etanercept;
    b) Hep B: untreated chronic or treated chronic with Child-Pugh class B or higher: avoid any biologic!
  - 2) Malignancy: a) treated solid malignancy >5yrs or non-melanoma skin ca >5ys ago – recommend any biologic;
    b) treated solid malignancy <5yr or treated non-melanoma skin ca within 5yr – recommend rituximab;
    c) treated skin melanoma, & treated lymphoproliferative malignancy – recommend rituximab;
  - 3) CHF: a) NYHA class III-IV with ejection fraction ≤50%: avoid anti-TNF biologics!

Vaccinations: before DMARD or biologic, immunize for influenza, pneumococcal, hep-B & HZV. Live vaccines should not be given to patients on biologics (should be given ≥1 month prior to starting tx).

Pain Management in RA:

- Neuromodulators: Cochrane Review RCT, placebo controlled - few trials, all short term (~2-5 weeks) with high risk of bias (ie. Weak evidence)
  1) Nefopam (ACUPAN): not in Canada; 5HT, NE & DA receptor blocking; NNT=2 for pain relief, offset by significant SE's
  2) Topical capsaicin: reasonable add-onn option; NNT=2-3 for pain relief, offset by some burning at application site
  3) Oromucosal cannabis: small reduction in pain, highly offset by SE's leading to withdrawal (NNH=3) including dizziness 26%, dry mouth 13% & lightheadedness (10%)
  4) Lack of data for other agents included: anticonvulsants, ketamine, bupropion, methylphenidate

FDA July/10 will require that the label for the rheumatoid arthritis drug **leflunomide (Arava)** carry an added warning for severe liver injury. The label already warns against the drug's use in pregnant women and those of childbearing potential. The new warning comes after the FDA received **49 reports of severe liver injury**, including 14 instances of fatal liver failure, from 2002 to 2009. Risk for liver injury was higher among patients using other drugs associated with liver injury and patients with liver disease. Clinicians should monitor liver enzymes at least monthly for 3 months after beginning the drug. After that, enzymes should be monitored every quarter. Treatment should be halted if liver enzymes rise to two times the upper limit of normal. http://www.fda.gov/Safety/MedWatch/SafetyInformation/SafetyAlertsforHumanMedicalProducts/ucm218912.htm

FDA Sep/11 notified healthcare professionals that the Boxed Warning for the entire class of **Tumor Necrosis Factor-alpha (TNFα) blockers** has been updated to include the risk of infection from two bacterial pathogens, **Legionella and Listeria**. In addition, the Boxed Warning and Warnings and Precautions sections of the labels for all of the TNFα blockers have been revised so that they contain consistent information about the risk for serious infections and the associated disease-causing pathogens.

Clinical and radiographic outcomes of **four different treatment strategies in patients with early rheumatoid arthritis (the BeSt study)**: A randomized, controlled trial. Arthritis Rheum. 2005 Nov;52(11):3381-90. CONCLUSION: In patients with early RA, initial combination therapy including either prednisone or infliximab resulted in earlier functional improvement and less radiographic damage after 1 year than did sequential monotherapy or step-up combination therapy. (Goekoop-Ruiterman YP, de Vries-Bouwstra JK, Allaart CF, et al. Comparison of treatment strategies in early rheumatoid arthritis: a randomized trial (BeSt). Ann Intern Med. 2007 Mar 20;146(6):406-15. Currently available antirheumatic drugs can be highly effective in patients with early rheumatoid arthritis in a setting of tight disease control. Initial combination therapies seem to provide earlier clinical improvement and less progression of joint damage, but all treatment strategies eventually showed at 2yrs similar clinical improvements. In addition, combination therapy can be withdrawn successfully and less treatment adjustments are needed than with initial monotherapies.)

Hjardem E, Ostergaard M, Podenphant J, et al.. Do rheumatoid arthritis patients in clinical practice benefit from **switching from infliximab to a second tumor necrosis factor** alpha inhibitor? Ann Rheum Dis. 2007 Sep;66(9):1184-9. Epub 2007 Mar 27. Lack of efficacy switchers had a better clinical response to the second treatment. Adverse effect switchers responded equally well to both treatments, with a low risk of discontinuing the second drug as a result of AE. Drug survival of the switchers' second biological therapy was higher than of the first, but lower than that of non-switchers. No difference between various sequences of drugs were found. Danish post-marketing data thus support that RA patients may benefit from switching biological therapy.

Singh JA, Beg S, Lopez-Olivo MA. **Tocilizumab** for rheumatoid arthritis. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008331. Tocilizumab is beneficial in decreasing RA disease activity and improving function. Tocilizumab treatment was associated with significant increase in cholesterol levels and in total adverse events. Larger safety studies are needed to address these safety concerns.
Singh JA, Wells GA, Christensen R, et al. **Adverse effects of biologics**: a network meta-analysis and Cochrane overview. Cochrane Database of Systematic Reviews 2011, Issue 2. Art. No.: CD008794. DOI: 10.1002/14651858.CD008794.pub2. Overall, in the short term biologics were associated with significantly higher rates of total adverse events, withdrawals due to adverse events and TB reactivation. Some biologics had a statistically higher association with certain adverse outcomes compared to control, but there was no consistency across the outcomes so caution is needed in interpreting these results.

Arthritis Rheum. 2006 Nov 29;54(12):3790-3798. Monotherapy with oral glucocorticoids was associated with an increased risk of cardiovascular events (OR 1.5, 95% CI 1.1 - 2.1), and a similar trend in the direction of risk was seen with glucocorticoid combination therapy (OR 1.3, 95% CI 0.8-2.0). Cytotoxic immunosuppressive agents other than MTX (azathioprine, cyclosporine, and leflunomide) were also associated with an increased risk of cardiovascular events (with both monotherapy and combination treatment, OR 1.8, 95% CI 1.1-3.0). When compared with RA patients receiving MTX monotherapy, those receiving biologic immunosuppressive agents had neither an increased nor decreased risk of experiencing a cardiovascular event, whereas use of oral glucocorticoids and cytotoxic immunosuppressive agents was associated with significant increases in the risk of cardiovascular events.

Melnik T, Soares B, Nasselo A. **Psychosocial interventions** for erectile dysfunction. Cochrane Database Syst Rev. 2007 Jul 18;(3):CD004825. There was evidence that group psychotherapy may improve erectile function. Treatment response varied between patient subgroups, but focused sex-group therapy showed greater efficacy than control group (no treatment). In a meta-analysis that compared group therapy plus sildenafil citrate versus sildenafil, men randomised to receive group therapy plus sildenafil showed significant improvement of successful intercourse, and were less likely than those receiving only sildenafil to drop out. Group psychotherapy also significantly improved ED compared to sildenafil citrate alone. Regarding the effectiveness of psychosocial interventions for the treatment of ED compared to local injection, vacuum devices and other psychosocial techniques, no differences were found.

MHRA Feb/12 has received advice from AGES PharmMed in Austria and the Danish Medicines Agency, warning that these unlicensed products have been tested and found to contain Tadalafil and/or Sildenafil: **AH Free/Reflexit, Stree Overlord, Man King, VigRX, Maxman, Maxman III, Viriya, & Imbiza for Men.**

Lancet. 2006 Sep 9;368(9539):929-37. (InfoPOEMs: In this study, dapoxetine (an investigational new short-acting selective serotonin reuptake inhibitor) taken 1 to 3 hours before sexual activity delayed ejaculation in men with moderate-to-severe premature ejaculation. The net improvement due to medication was less than 2 minutes compared with baseline, but patients and partners were satisfied with this small amount of improvement. (LOE = 2b))
Qaseem A., Snow V., Denberg T. D., et al and for the Clinical Efficacy Assessment Subcommittee of the American College of Physicians. **Hormonal Testing and Pharmacologic Treatment of Erectile Dysfunction**: A Clinical Practice Guideline From the American College of Physicians. *Ann Intern Med* 2009; 60520-151.
Recommendation 1: The American College of Physicians recommends that clinicians initiate therapy with a PDE-5 inhibitor in men who seek treatment for erectile dysfunction and who do not have a contraindication to PDE-5 inhibitor use (Grade: strong recommendation; high-quality evidence).
Recommendation 2: The American College of Physicians recommends that clinicians base the choice of a specific PDE-5 inhibitor on the individual preferences of men with erectile dysfunction, including ease of use, cost of medication, and adverse effects profile (Grade: weak recommendation; low-quality evidence).
Recommendation 3: The American College of Physicians does not recommend for or against routine use of hormonal blood tests or hormonal treatment in the management of patients with erectile dysfunction (Grade: insufficient evidence to determine net benefits and harms).
Raina R, Pahlajani G, Agarwal A, Zippe CD. The early use of transurethral alprostadil after radical prostatectomy potentially facilitates an earlier return of erectile function and successful sexual activity. BJU Int. 2007 Dec;100(6):1317-21. Extras:

1) ACs, Other: **propantheline** -less effective & ↑ SE than flavoxate & oxybutynin.[11] NICE states not to use[1]; Adult: 7.5mg tid, 7.5-30mg 3-5x/day, 60mg qid; Geriatric: 7.5mg tid; Peds: 7.5-15mg q4-6h;
2) Adrenoreceptor agonists (**phenylpropanolamine** predominantly studied but use extended to **ephedrine**, **pseudoephedrine**): studied for SUI. But cardiac arrhythmias & HTN outweigh benefits [31].
3) **Belladonna & opium suppositories**-used to relieve **pain of uretal spasms** & pain associated with bladder tenesmus that can occur post-op[32]. Some report use in nocturnal diuresis[11]
dicyclomine -insufficient data to recommend over other agents, dose 20-40mg qid.[11]
4) **Flavoxate**: Not used for OAB currently[1] but may be used in discomfort associated with BPH. Efficacy might be comparable to propantheline according to older, short-term studies[11].
Dose: Adult: 100-200mg tid-qid. May reduce dose with Sx improvement. One trial found 1200mg to be superior to 600mg/day. May be effective in children from 6-12 y/o experiencing nocturnal enuresis (33% vs 17% response in placebo)[11]. Pediatrics > 12y/o: 100-200mg tid-qid. May reduce dose with Sx improvement[11].
5) **Phenazopyridine**[11]: used strictly as a **urinary analgesic**. The necessity of this medication would suggest pathology different from UI. Dose: Adult: 200mg tid after meals. If renal GFR > 50ml/min 200mg q8-16h. Avoid if GFR < 50ml/min. Geriatrics: ↑risk of accumulation & toxicity. SE: discolor urine
6) **Propiverine** [53]: tertiary amine with anticholinergic & calcium channel antagonist activity; has active metabolites; dose: 15mg IR bid or 30mg ER daily; available United Kingdom [2006].

Oxybutynin (Oxy) vs Tolterodine in OAB

- OBJECT: Oxy ER 10mg daily vs Tolt IR 2mg BID; 12 week; ♂ & ♀; Oxy ER slightly more effective (e.g. Total incontinence episodes/wk: NNT=45); no difference in overall AEs (dry mouth, CNS effects).[52]
- OPERA: Oxy ER 10mg vs Tolt ER 4mg daily; 12 week; ♀ only with severe symptoms; Oxy ER somewhat more effective (e.g. 23 vs 16.8% no UI; NNT=16); but also more dry mouth (Any 29.7% vs 22.3%; NNH=13; mod-severe 7.4% vs 5.0% , NS).[50]
- ACET: Oxy ER 5 or 10mg vs Tolt ER 2 or 4mg daily; 8 week; ♂ & ♀; Tolt 4mg more effective than Oxy 10 70 vs 60% improvement; but lower doses efficacy still ~60% & less dry mouth but similar for Tolt 4 vs Oxy 5 ; open label trial & subjective assessments subject to bias.[51]

12. Kay G, Crook T, Rekeda L, Lima R, et al. Darifenacin has theoretical cognitive advantages. Some preliminary placebo controlled trials have results supporting this claim. At first glance this trial by Key et al. appears to support these advantages based on the *name-face association test*. However when trial design issues (e.g. high oxybutinin dose for elderly, early drop outs), discussion bias, adverse event rates and overall limitations are considered, this study does not prove a definite advantage for darifenacin over oxybutynin. Further study is needed (especially with a more rational dose comparator) in elderly with urinary incontinence and at high risk for cognitive impairment. Darifenacin may offer a relative advantage or disadvantage to other anticholinergics depending on dose used and individual patient response. Currently, darifenacin offers a cost advantage over some comparators. {Cost/month[SK]: Enablex 7.5-15mg/day= $59; Ditropan XL 5-10mg/day= $84,15-20mg/day=$159; Uromax10-15mg/day=$50-53; Detrol LA 2-4mg/day= $72.} See http://www.rxfiles.ca/acrobat/UI-Darifenacin-Kay-Trial-Q&A.pdf }

Cody JD, Richardson K, Moehrer B, et al. Oestrogen therapy for urinary incontinence in post-menopausal women. Cochrane Database Syst Rev. 2009 Oct 7;(4):CD001405. Local oestrogen treatment for incontinence may improve or cure it, but there was little evidence from the trials on the period after oestrogen treatment had finished and none about long-term effects. However, systemic hormone replacement therapy, using conjugated equine oestrogen, may make incontinence worse. There were too few data to reliably address other aspects of oestrogen therapy, such as oestrogen type and dose, and no direct evidence on route of administration. The risk of endometrial and breast cancer after long-term use suggests that oestrogen treatment should be for limited periods, especially in those women with an intact uterus.

Naumann M, So Y, Argoff CE, Childers MK, Dykstra DD, Gronseth GS, Jabbari B, Kaufmann HC, Schurch B, Silberstein SD, Simpson DM; Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Assessment: Botulinum neurotoxin in the treatment of autonomic disorders and pain (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 May 6;70(19):1707-14. Botulinum neurotoxin (BoNT) should be offered as a treatment option for the treatment of axillary hyperhidrosis and detrusor overactivity (Level A), should be considered for palmar hyperhidrosis, drooling, and detrusor sphincter dyssynergia after spinal cord injury (Level B), and may be considered for gustatory sweating and low back pain (Level C). BoNT is probably ineffective in episodic migraine and chronic tension-type headache (Level B). There is presently no consistent or strong evidence to permit drawing conclusions on the efficacy of BoNT in chronic daily headache (mainly transformed migraine) (Level U). While clinicians' practice may suggest stronger recommendations in some of these indications, evidence-based conclusions are limited by the availability of data.
Dmochowski R, Chapple C, Nitti VW, et al. Efficacy and Safety of **OnabotulinumtoxinA** for Idiopathic Overactive Bladder: A Double-Blind, Placebo Controlled, Randomized, Dose Ranging Trial. J Urol. 2010 Dec;184(6):2416-22.
Duthie JB, Vincent M, Herbison GP, et al. **Botulinum toxin injections** for adults with overactive bladder syndrome. Cochrane Database Syst Rev. 2011 Dec 7;12:CD005493. Intravesical botulinum toxin appears to be an effective therapy for refractory OAB symptoms, but as yet little controlled trial data exist on benefits and safety compared with other interventions, or with placebo.

Kramer BS, Hagerty KL, Justman S, et al. Use of 5alpha-Reductase Inhibitors for **Prostate Cancer Chemoprevention**: American Society of Clinical Oncology/American Urological Association 2008 Clinical Practice Guideline. J Urol. 2009 Feb 24. [Epub ahead of print] Asymptomatic men with a prostate-specific antigen (PSA) </=3.0 ng/mL who are regularly screened with PSA or are anticipating undergoing annual PSA screening for early detection of prostate cancer may benefit from a discussion of both the benefits of 5-ARIs for 7 years for the prevention of prostate cancer and the potential risks (including the possibility of high-grade prostate cancer). Men who are taking 5-ARIs for benign conditions such as lower urinary tract [obstructive] symptoms (LUTS) may benefit from a similar discussion, understanding that the improvement of LUTS relief should be weighed with the potential risks of high-grade prostate cancer from 5-ARIs (although the majority of the Panel members judged the latter risk to be unlikely). A reduction of approximately 50% in PSA by 12 months is expected in men taking a 5-ARI; however, because these changes in PSA may vary across men, and within individual men over time, the Panel cannot recommend a specific cut point to trigger a biopsy for men taking a 5-ARI. No specific cut point or change in PSA has been prospectively validated in men taking a 5-ARI. http://jco.ascopubs.org/cgi/reprint/27/9/1502

FDA June/11 notified that the Warnings and Precautions section of the labels for the 5-alpha reductase inhibitor (5-ARI) class of drugs has been revised to include new safety information about the **increased** risk of being diagnosed with a more serious form of prostate cancer **(high-grade prostate cancer)**. {PCPT & Reduce
FDA reviewed data from two prostate cancer prevention trials. In one, finasteride (given daily for 7 years) was associated with a higher frequency of prostate cancers with Gleason scores between 8 and 10, compared with placebo (1.8% vs. 1.1%). In the other, dutasteride (given daily for 4 years) was also associated with more high-grade cancers relative to placebo (1% vs. 0.5%)}.

96a. Singh A, Alter HJ, Littlepage A. A systematic review of medical therapy to facilitate passage of **ureteral calculi**. Ann Emerg Med. 2007 Nov;50(5):552-63. Epub 2007 Aug 3. Our results suggest that "medical expulsive therapy," using either alpha-antagonists or calcium channel blockers, augments the stone expulsion rate compared to standard therapy for moderately sized distal ureteral stones. This meta-analysis of low-quality studies shows that ureteral stone passage can be enhanced by treating patients with an alpha-blocker such as tamsulosin (Flomax) or the calcium channel blocker nifedipine (Procardia). Better studies may refute these findings, but for now either approach is an option. (LOE = 1a-).

100. Thomas LH, et al. Treatment of urinary incontinence **after stroke** in adults. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD004462. Data from the available trials are insufficient to guide continence care of adults after stroke. However, there was suggestive evidence that professional input through structured assessment and management of care and specialist continence nursing may reduce urinary incontinence and related symptoms after stroke.
101. Cantrell MA, Bream-Rouwenhorst HR, Steffensmeier A, et al.Intraoperative Floppy Iris Syndrome Associated with {alpha}1-Adrenergic Receptor Antagonists (April). Ann Pharmacother. 2008 Mar 25; [Epub ahead of print] Other alpha1AR antagonists, including terazosin, doxazosin, and alfuzosin, have also been linked to IFIS; however, their relationship to the syndrome is not as definitive. **IFIS** is a clinical syndrome observed during cataract surgery reported in patients taking systemic alpha1AR antagonists. It has been most strongly linked to use of tamsulosin. Medication washout periods of up to 2 weeks and specific surgical procedures have been attempted to reduce risk of complications from alpha1AR antagonists in the setting of cataract surgery.
102. Wilt T, et al. **Five-alpha-reductase Inhibitors for prostate cancer prevention**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD007091. 5ARI reduce prostate cancer risk but may increase risk of high-grade disease in men who are undergoing regular screening for prostate cancer using prostate specific antigen & digital rectal examination. Effects are consistent across race, family history and age and possibly 5ARI but were limited to men with baseline PSA values <4.0 ng/mL.
103. Chapple CR, Khullar V, Gabriel Z, Muston D, Bitoun CE, Weinstein D. The Effects of **Antimuscarinic** Treatments in Overactive Bladder: An Update of a **Systematic Review** and Meta-Analysis. Eur Urol. 2008 Jun 20. [Epub ahead of print] Antimuscarinics are efficacious, safe, and well-tolerated treatments that improve HRQL. Profiles of each drug and dosage differ and should be considered in making treatment choices.

156. FDA July/11 **Surgical placement of mesh to repair pelvic organ prolapse poses risks.** In treating pelvic organ prolapse, use of mesh, especially if placed transvaginally, "may expose patients to greater risk than other surgical options," the FDA warned this week. The agency estimates there were at least 100,000 prolapse repairs done with mesh last year, most done transvaginally. The FDA reports that the most frequent complications resulting from mesh include protrusion of the mesh out of vaginal tissue, pain, infection, bleeding, and pain during intercourse. http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm262752.htm
157. Health Canada Aug/11 is informing healthcare practitioners and patients of a labelling update for **finasteride drugs to add safety information on rare reports of breast cancer in men**.
158. FDA Aug/11 Botox (onabotulinumtoxinA) has been approved to treat urinary incontinence in patients with overactive bladder due to neurologic conditions (e.g., multiple sclerosis).

167. Madhuvrata P, Cody JD, Ellis G, et al. Which **anticholinergic drug for overactive bladder symptoms in adults**. Cochrane Database Syst Rev. 2012 Jan 18;1:CD005429. Where the prescribing choice is between oral immediate release oxybutynin or tolterodine, tolterodine might be preferred for reduced risk of dry mouth. With tolterodine, 2 mg twice daily is the usual starting dose, but a 1 mg twice daily dose might be equally effective, with less risk of dry mouth. If extended release preparations of oxybutynin or tolterodine are available, these might be preferred to immediate release preparations because there is less risk of dry mouth. Between solifenacin and immediate release tolterodine, solifenacin might be preferred for better efficacy and less risk of dry mouth. Solifenacin 5 mg once daily is the usual starting dose, this could be increased to 10 mg once daily for better efficacy but with increased risk of dry mouth. Between fesoterodine and extended release tolterodine, fesoterodine might be preferred for superior efficacy but has higher risk of withdrawal due to adverse events and higher risk of dry mouth.There is little or no evidence available about quality of life, costs, or long-term outcome in these studies. There were insufficient data from trials of other anticholinergic drugs to draw any conclusions.
168. Burgio KL, Goode PS, Johnson TM, et al. **Behavioral versus drug treatment** for overactive bladder in **men**: the Male Overactive Bladder Treatment in Veterans (MOTIVE) Trial. J Am Geriatr Soc. 2011 Dec;59(12):2209-16.
169. Campbell SE, Glazener CM, Hunter KF, et al. Conservative management for **postprostatectomy urinary incontinence**. Cochrane Database Syst Rev. 2012 Jan 18;1:CD001843. The value of the various approaches to conservative management of postprostatectomy incontinence after radical prostatectomy remains uncertain. It seems unlikely that men benefit from one-to-one pelvic floor muscle training therapy after transurethral resection of the prostate (TURP). Long-term incontinence may be managed by external penile clamp, but there are safety problems.
170. Health Canada Mar/12 is informing health professionals and the public that the prescription drugs **finasteride and dutasteride** may be associated with an increased risk of developing a serious form of prostate cancer known as **high-grade prostate cancer**.
171. FDA: Apr/12 The labels of the alopecia drug Propecia (**finasteride** 1 mg) and the benign prostatic hyperplasia drug Proscar (finasteride 5 mg) are being updated with an expanded list of adverse **sexual effects**, the FDA has announced. Propecia label will include libido, ejaculation, and orgasm disorders that persist after treatment ends; Proscar label will include decreased libido that persists posttreatment & both labels will note reports of male infertility or poor semen quality that improved after drug discontinuation.

TOP

1) Breaking the "cold chain"

Canadian Guidelines: Refrigerated vaccines should be stored between +2°C and +8°C. Frozen vaccines should be stored at -15°C or colder. Store light sensitive vaccines away from light. Follow manufacturer recommendations for storage & transport. Administration requires someone trained to give im/sc injections.

Fridges:

-Fridge used should be dedicated to the storage of vaccines only.

-**Use of bar fridges for vaccine storage is the leading cause of cold chain breaks in Canada. Bar fridges are not recommended for the purpose of storing vaccines.**

- Keeping temperature of fridge stable **(2-8° C)**: Avoid opening refrigerator door unnecessarily, store containers of water in refrigerators, or ice packs in the freezer

NEVER store vaccines in the vegetable bin section of the refrigerator. Ideal storage location for vaccine: In the middle compartment, away from floor, coils, walls, and venting for the freezer or cold air.

-Temperature of the compartments of the refrigerator where the vaccine is stored should be checked and logged at least twice a day. Fridge temperatures outside of the 2 to 8 degree C range must be reported immediately to obtain recommendation on the stability of the affected product.

- Fridge temperature recording logs should be retained for 2 years.

- Min-Max thermometer batteries should be routinely changed twice a year: December 1 and June 1 and the date of changing noted on the device.

Transporting Refrigerated Vaccines: Avoid breaking the cold chain

1) Transport vaccines in insulated containers at all times. Hard sided plastic insulated containers, or Styrofoam containers with walls at least 2 inch thick walls should be used. Icepacks should be placed inside the transport container to maintain the cold chain. To prevent freezing the vaccine should never be placed directly onto an ice pack. Instead an insulating barrier (i.e. bubble wrap, Styrofoam peanuts) should be placed between vaccine and ice pack.
2) Make sure vaccine is never placed in trunk of vehicle, or in direct contact with sunlight. Also the vaccine should not be placed in line with the air from the vehicles heater or air conditioner. Vaccine should never be left in a vehicle unattended.
3) If a break in the cold chain identified prior to administration of the vaccine, contact your local public health authority about the appropriate course of action. While waiting for a decision, ensure that the vaccine is stored in appropriate cold chain conditions. The vaccine should not be administered until a decision has been reached.
4) If a break in the cold chain is identified after administration of the vaccine, contact your local public health authority. The type of vaccine, duration and temperature of the exposure will be taken into account in order to determine the course of action. Serological testing or revaccination may be suggested.

2) Anaphylaxis Management with vaccine administration:

1) Patients should be kept under supervision for 15 minutes (JE-VAX: 30 minutes) following administration.
2) In order to treat anaphylaxis perform the following steps (note steps a-d should be performed rapidly or simultaneously, however the priority is to complete step a):
   a) **Promptly administer 0.01 mL/kg (maximum 0.5 mL) of aqueous epinephrine 1:1000 by intramuscular (or subcutaneous) injection in the opposite limb to that in which the vaccination was given (or the vastus lateralis). Prompt administration is essential.**
   b) Call for an ambulance
   c) Place the patient in a recumbent position, and elevate their feet.
   d) If necessary, establish an oral airway.
   e) Patients with severe reactions such as cyanosis, dyspnea, should be given oxygen if it is available. Pulse oximetry can be used to monitor if available.
   f) If the vaccine was administered subcutaneously, an additional dose of 0.005 mL/kg (maximum 0.3 mL) of aqueous epinephrine 1:1000, can be injected into the vaccination site to slow down absorption. This should be done shortly after administration of the first dose of epinephrine in moderate to severe cases, and generally should not be repeated. Local injection of epinephrine into an intramuscular vaccination site is contraindicated, as it speeds up absorption of the vaccine.
   g) A dose of diphenhydramine hydrochloride (Benadryl®) can be given as an adjunct to epinephrine. The oral route of diphenhydramine is preferred for conscious patients who are not seriously ill (as the intramuscular injection is painful). Oral dose: 1-2 mg/kg to a maximum single dose of 50 mg.
   h) An inhaled β-agonist should be considered if there is a bronchospasm resistant to an adequate dose of epinephrine (e.g., nebulized salbutamol 2.5-5.0 mg in 3 mL of saline or 1 puff per 3 kg to a maximum of 10 puffs by metered dose inhalers).
   i) Vital signs should be monitored continuously.
   j) Patient should be transported to emergency department for long term monitoring.

◆Epinephrine dosing can be repeated twice at 5-minute intervals if necessary, for a total of three doses. The limb in which the vaccination was given should be avoided. A different limb is preferred for each dose to maximize drug absorption.

3) **Breastfeeding and Vaccinations:** Immunizations for actively breastfeeding women are considered safe, with the exception of smallpox vaccine and yellow fever, by both the CDC and the American academy of pediatrics. Breastfeeding does not appear to influence the maternal immune response. Vaccines do not appear to affect the safety of breast milk for infants.[10,11]

The evidence to support the efficacy of pneumococcal polysaccharide vaccine (PPV) in adults is limited at best. The best studies have not shown a consistent benefit, particularly in the most vulnerable populations that we currently target. The impact of increasing herd immunity due to infant vaccination using conjugate vaccines is another factor, although that is not addressed by this analysis. An accompanying editorial argues that some studies excluded for methodologic limitations should have been included, and vice versa, and called for additional well-designed studies in relevant populations rather than a cessation of the vaccination. FDA Oct/10 **Rotarix**: The risk of intussusception with Rotarix has been evaluated in a hospital-based Postmarketing Active Surveillance Study (PASS) in a birth cohort of infants in Mexico. An interim analysis of this study suggests an increased risk of intussusception in the 31-day period following administration of the first dose of Rotarix[Relative Risk: 1.8 (99% CI: 1.0, 3.1)]. In this study, within the 31-day period after the first dose, most cases of intussusception occurred in the first 7 days.

Jansen AG, Hak E, Veenhoven RH, et al. **Pneumococcal conjugate vaccines** for preventing otitis media. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD001480. Based on current evidence of the effectiveness of PCVs for the prevention of AOM, the currently licensed 7-valent PCV administered during infancy has marginal beneficial effects. Discrete reductions of 6% to 7% may mean substantial reductions from a public health perspective. Administering PCV7 in older children with a history of AOM appears to have no benefit in preventing further episodes.

Jefferson T, Di Pietrantonj C, Rivetti A, et al. **Vaccines for preventing influenza** in healthy adults. Cochrane Database Syst Rev. 2010 Jul 7;7:CD001269. Influenza vaccines have a modest effect in reducing influenza symptoms and working days lost. There is no evidence that they affect complications, such as pneumonia, or transmission.

Prevnar 13: December 22, 2009 -- Health Canada has approved a pneumococcal 13-valent conjugate vaccine (Diphtheria CRM197 Protein [Prevnar 13] for children aged 6 weeks through 5 years for active immunisation against invasive pneumococcal disease. The 13-valent vaccine is designed to provide the broadest coverage of any pneumococcal conjugate vaccine. The new vaccine includes strains 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F -- responsible for the greatest remaining burden of invasive disease in young children worldwide.

Rabies CDC recommendations Mar/2010 : Mar/10 Routine **rabies post-exposure prophylaxis** will now entail a total of five shots — four of vaccine and one of rabies immune globulin — according to an article in MMWR Recommendations and Reports. The change to fewer doses was made based on studies showing that the fifth vaccine shot did not improve outcomes. The Advisory Committee on Immunization Practices recommends: Two shots — one of vaccine and one of rabies immune globulin — given as soon as possible after exposure. Taking the day of the first shots as Day 0, the other vaccine shots should be administered on Days 3, 7, and 14. If immune globulin is not given on Day 0, it should be given by Day 7. Immunocompromised patients should continue to receive all five vaccine shots, with the fifth on Day 28. Vaccine shots may be delivered to the outer aspect of the thigh in younger children and to the deltoid in older children and adults. The gluteal region should never be used.The authors note that their recommendations will differ from vaccine label instructions into the foreseeable future.MMWR Recommendations and Reports: http://cdc.gov/mmwr/preview/mmwrhtml/rr5902a1.htm

TOP

Anti-inflammatory properties of topical antifungal preparations:

It is difficult to determine the anti-inflammatory effects of topical antifungals in humans as the majority of studies are completed as *in vitro* studies or in animal models. Some studies compared antifungal drugs alone to a combination of antifungal plus steroid combination and had similar efficacies in treatment. A small study (n=20) assessed and compared *in vivo* anti-inflammatory effects of terbinafine, ciclopirox, ketoconazole and other antifungals (econazole, oxiconazole- not commonly used in Canada) with hydrocortisone 2.5%. This study looked at the ability to decrease erythema due to UVB exposure which is thought to mimic the response in dermatophyte infections. It did not study the effects in an actual dermatophyte–induced inflammatory reaction. Terbinafine, ciclopirox, and ketoconazole all demonstrated anti-inflammatory effects. Terbinafine and ciclopirox exhibited statistically significant difference in erythema when compared to control than ketoconazole, econazole, oxiconazole, and hydrocortisone. Ketoconazole exhibited intermediate anti-inflammatory effects. May consider use of these antifungals if there is an inflammatory component to the fungal infection.

TOP

Extras:

- AOM: Prophylactic tx no longer recommended
- Conjunctivitis: 85% viral in adults. Suggest antibiotics if there's no improvement within 5 days or sooner (if the school or daycare requires treatment to come back). Handwashing important to help prevent spread. Bacterial infections are infectious for 24-48 hours after ABX initiation, viral are infectious until the eye clears. Consider washing contact case and replacing contacts if disposable, replace bottle of eye drops if any are used (eg glaucoma). Bacterial=Purulent discharge, swelling of the eye, and a burning sensation, usually persisting throughout the day, red or pink colour of the eye and pts often complain of waking up with eyes "glued shut". Red flag sx: a great deal of discomfort and pain, changes in vision, nausea, vomiting, or severe headache, eyelid edema, severe, continuous, copious, purulent discharge or whose symptoms have persisted for longer than 72 hours should be examined by a medical practitioner. A mild, watery discharge, with itching associated with a concurrent upper respiratory infection signals viral-if only one eye affected, other eye becomes involved in half of the cases. Corticosteroid eyedrops may quickly relieve symptoms, but should be avoided as they can worsen or mask accompanying conditions such as herpetic keratitis.
- Impetigo: [Retapamulin Altargo topical USA: for impetigo if resistance]
- Pharyngitis: *Fusobacterium necrophorum* just as common as GAS (~10%) in ages 15-24 and can cause Lemierre syndrome, a life-threatening condition. ABX tx can shorten symptom duration by ~16 hours.

STI

- EPT or Expedited Partner Treatment : a practice where a second prescription is given for chlamydia or gonorrhea, often to the index patient, for the partner
- External Genital Warts (EGW) - adult: caused by human papilloma virus (HPV) especially types 6 & 11; Tx options : 1) Imiquimod 5% cream Apply HS 3x/week; 2) Podofilox 0.5% soln Apply BID x3 days, then no tx x4 days; repeat cycle up to 3x.; 3) Cryotherapy Physician to apply liquid nitrogen q1-2 weeks for maximum 8 weeks; 4)Podophyline 10-25% resin in tincture of benzoin Apply small amount, allow to dry, repeat weekly if necessary (may wash resin off after 1-4hrs application; 5) Trichloroacetic acid 80-90% in 70% alcohol Apply small amount to warts, allow to dry, repeat weekly if necessary (5% EMLA cream pre-application may be used to ↓ burning; 6) Laser tx; 7) Surgical removal.
- Follow-up testing for Chlamydia & gonorrhea: retesting recommended at 3 months after tx.

Ahovuo-Saloranta A, Borisenko OV, Kovanen N, et al. Antibiotics for acute maxillary **sinusitis**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD000243. Antibiotics have a small treatment effect in patients with uncomplicated acute sinusitis in a primary care setting with symptoms for more than seven days. However, 80% of participants treated without antibiotics improve within two weeks. Clinicians need to weigh the small benefits of antibiotic treatment against the potential for adverse effects at both the individual and general population level.

DOI: 10.1002/14651858.CD003048.pub3. Used alongside rehydration therapy, probiotics appear to be safe and have clear beneficial effects in shortening the duration and reducing stool frequency in acute infectious diarrhoea. However, more research is needed to guide the use of particular probiotic regimens in specific patient groups.

Altamimi S, Khalil A, Khalaiwi KA, et al. Short versus standard duration antibiotic therapy for **acute streptococcal pharyngitis in children**. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD004872. Three to six days of oral antibiotics had comparable efficacy compared to the standard duration 10 day oral penicillin in treating children with acute GABHS pharyngitis. In countries with low rates of rheumatic fever, it appears safe and efficacious to treat children with acute GABHS pharyngitis with short duration antibiotics. In areas where the prevalence of rheumatic heart disease is still high, our results must be interpreted with caution.

Dhiwakar M, Clement WA, Supriya M, McKerrow W. Antibiotics to reduce **post-tonsillectomy** morbidity. Cochrane Database Syst Rev. 2010 Jul 7;7:CD005607. The present systematic review, including meta-analyses for select outcomes, suggests that although individual studies vary in their findings, there is no evidence to support a consistent, clinically important impact of antibiotics in reducing the main morbid outcomes following tonsillectomy (i.e. pain, need for analgesia and secondary haemorrhage rates). Limited benefit apparent with antibiotics may be a result of positive bias introduced by several important methodological shortcomings in the included trials. Based on existing evidence therefore, we would advocate against the routine prescription of antibiotics to patients undergoing tonsillectomy. Whether a subgroup of patients who might benefit from selective administration of antibiotics exists is unknown and needs to be explored in future trials.

Karageorgopoulos DE, Giannopoulou KP, Grammatikos AP, et al. Fluoroquinolones compared with beta-lactam antibiotics for the treatment of **acute bacterial sinusitis**: a meta-analysis of randomized controlled trials. CMAJ. 2008 Mar 25;178(7):845-54. In the treatment of acute bacterial sinusitis, newer fluoroquinolones conferred no benefit over beta-lactam antibiotics. The use of fluoroquinolones as first-line therapy cannot be endorsed. The authors found no benefit to fluoroquinolones over beta-lactams for acute bacterial rhinosinusitis (ABRS). The more important and relevant questions are whether we can distinguish ABRS from viral sinusitis (not very well) and whether antibiotics are needed at all (probably not for most patients). If you decide to prescribe an antibiotic because of severity of illness or duration of symptoms, a beta-lactam will work as well as a fluoroquinolone. (LOE = 1a)

Koning S, van der Sande R, Verhagen AP, et al. **Interventions for impetigo**. Cochrane Database Syst Rev. 2012 Jan 18;1:CD003261. There is good evidence that topical mupirocin and topical fusidic acid are equally, or more, effective than oral treatment. Due to the lack of studies in people with extensive impetigo, it is unclear if oral antibiotics are superior to topical antibiotics in this group. Fusidic acid and mupirocin are of similar efficacy. Penicillin was not as effective as most other antibiotics. There is a lack of evidence to support disinfection measures to manage impetigo.

BMJ 2005; 330:456-60. (InfoPOEMs: Strange, but true: Oral beta-lactam antibiotics -- amoxicillin, amoxicillin/clavulanate (Augmentin), or a cephalosporin -- are as effective in the treatment of community-acquired pneumonia as antibiotics active against atypical pathogens, even in patients infected with Mycoplasma pneumoniae or Chlamydia pneumoniae. These old standbys can be used instead of the more expensive drugs for most patients. Legionella infection still requires treatment with an antibiotic effective against atypical pathogens, but in these studies only 1.1% of the patients with nonsevere pneumonia had Legionella. These results are backed up by similar findings from clinical practice (Hedlund J, et al. Scand J Infect Dis 2002; 34:887-92). (LOE = 1a))
19. Golden MR, Whittington WL, et al. Effect of expedited treatment of sex partners on recurrent or persistent gonorrhea or chlamydial infection. N Engl J Med 2005; 352:676-85. (InfoPOEMs: Giving the pt a prescription for their partner(s) or having a staff member contact the pt's partners directly to offer treatment without an examination slightly reduces the risk of recurrent infection in the original pt. It is most helpful for patients with gonorrhea. (LOE = 1b-))
20. Olympia RP, et al. Effectiveness of oral dexamethasone in the treatment of moderate to severe pharyngitis in children. Arch Pediatr Adolesc Med 2005; 159:278-82. (InfoPOEMs: Children with moderate to severe throat pain, given a single oral dose of dexamethasone, experience faster resolution of pain and significant relief in the first 24 hours than those given placebo. After 24 hours, however, there was no significant difference in pain between groups. Interestingly, dexamethasone is more effective in children who test negative for strep. In fact, those who have a positive rapid strep assay are unlikely to have any benefit. This study is too small to have detected any important but uncommon complications of treatment. (LOE = 2b))

Effects of Antibiotic Therapy on Outcomes of Patients With Coronary Artery Disease: A Meta-analysis of Randomized Controlled Trials. JAMA. 2005;293:2641-2647. (Evidence available to date does not demonstrate an overall benefit of antibiotic therapy in reducing mortality or cardiovascular events in patients with CAD.)
23. Rovers MM, Black N, Browning GG, Maw R, Zielhuis GA, Haggard MP. Grommets in otitis media with effusion: an individual patient data meta-analysis. Arch Dis Child 2005; 90:480-85. (InfoPOEMs: Compared with watchful waiting, inserting pressure-equalizing tubes improves hearing in children with otitis media with effusion over the short term. Outcomes within 18 months, however, are the same. The tubes has no effect on language development. Watchful waiting is a reasonable option in most of these children. (LOE = 1a))
24. Gafter-Gvili A, Fraser A, Paul M, Leibovici L. Meta-analysis: antibiotic prophylaxis reduces mortality in neutropenic patients. Ann Intern Med. 2005 Jun 21;142(12 Pt 1):979-95. CONCLUSIONS: Antibiotic prophylaxis for neutropenic patients undergoing cytotoxic therapy reduces mortality. Mortality was substantially reduced when analysis was limited to fluoroquinolones. Antibiotic prophylaxis, preferably with a fluoroquinolone, should be considered for neutropenic patients.
25. Fuller JD, Low DE. A review of Streptococcus pneumoniae infection treatment failures associated with fluoroquinolone resistance. Clin Infect Dis. 2005 Jul 1;41(1):118-21. Epub 2005 May 26. There were 20 ciprofloxacin and levofloxacin treatment failures reported. Physicians should be aware, when treating pneumococcal respiratory tract infections in older patients with a fluoroquinolone, that clinical failures might occur, especially for patients with comorbid illnesses and a history of recent fluoroquinolone use.
26. Little P, Rumsby K, et al. Information leaflet & antibiotic prescribing strategies for acute lower respiratory tract infection: an RCT. JAMA. 2005 Jun 22;293(24):3029-35. CONCLUSION: No offer or a delayed offer of antibiotics for acute uncomplicated lower respiratory tract infection is acceptable, associated with little difference in symptom resolution, and is likely to considerably reduce antibiotic use and beliefs in the effectiveness of antibiotics.

28. Sharland M, Kendall H, Yeates D, et al. Antibiotic prescribing in general practice and hospital admissions for peritonsillar abscess, mastoiditis, and rheumatic fever in

TOP

time trend analysis. BMJ. 2005 Aug 6;331(7512):328-9. A fall of 50% in the prescribing of antibiotics to children in English general practice has not been accompanied by an increase in hospital admissions for peritonsillar abscess or rheumatic fever. (InfoPOEMs: More judicious prescribing of antibiotics for childhood respiratory infections has not increased the number of episodes of peritonsillar abscess or rheumatic fever. The effect on mastoidectomy is unclear, but a clinically important increase appears unlikely. (LOE = 2c))

29. Hoberman A, Dagan R, Leibovitz E, et al. Large dosage amoxicillin/clavulanate, compared with azithromycin, for the treatment of bacterial acute otitis media in children. Pediatr Infect Dis J. 2005 Jun;24(6):525-32. CONCLUSION: Amoxicillin/clavulanate was clinically & bacteriologically more effective than azithromycin among children with bacterial AOM, incl. cases caused by penicillin-resistant S. pneumoniae & beta-lactamase-positive H. influenzae.
30. Yates J. Traveler's diarrhea. Am Fam Physician. 2005 Jun 1;71(11):2095-100. Antimicrob Agents Chemother 2005; 49:2260-66. (InfoPOEMs:) Linezolid provides an alternative to vancomycin in the treatment of complicated skin and soft tissue infections, many of which are caused by methicillin-resistant Staph aureus (MRSA). The unblinded nature of this study, post hoc subgroup analyses, and failure to describe criteria for initiating oral versus intravenous therapy are serious limitations. Any trends toward an advantage for linezolid should be interpreted very cautiously. (LOE = 2b)

(InfoPOEMs: A 2-g oral dose of azithromycin is equivalent in effectiveness to intramuscular penicillin in the treatment of primary or latent syphilis. Clinicians should be aware that macrolide-resistant Treponema pallidum has already begun to emerge in North America and Ireland. (LOE = 1b))
39 Medical Letter Sept 26/05 Azithromycin Extended Release (ZMAX) for Sinusitis and Pneumonia p. 78.
40. Paradise JL, Campbell TF, Dollaghan CA, et al. Developmental outcomes after early or delayed insertion of tympanostomy tubes. N Engl J Med 2005; 353:576-86. (InfoPOEMs: Early insertion of tympanostomy tubes does not improve long-term clinical outcomes of importance (speech acquisition and hearing) in children with persistent otitis media with effusion. Delaying 6 months for bilateral effusion and 9 months for unilateral effusion before revisiting the decision to insert tubes is the preferred approach to management, since it results in fewer procedures with equivalent outcomes. (LOE = 1b))
41. Pichichero ME. A review of evidence supporting the American Academy of Pediatrics recommendation for prescribing **cephalosporin antibiotics for penicillin-allergic** patients. Pediatrics. 2005 Apr;115(4):1048-57. Pichichero ME. Cephalosporins can be prescribed safely for penicillin-allergic patients. J Fam Pract. 2006 Feb;55(2):106-12. (InfoPOEMs: The risk of cross-reactivity between penicillin and cephalosporins has been overestimated for second- and third-generation drugs. It is only a significant risk in first-generation cephalosporins that have a similar side chain to penicillin (cephalothin, cephalexin, cefadroxil, and cefazolin). With appropriate monitoring physicians could consider using second- and third-generation cephalosporins in these patients. (LOE = 2a))

(LOE = 1a))
60. Fourcroy JL, Berner B, Chiang YK, Cramer M, Rowe L, Shore N. Efficacy and safety of a novel once-daily extended-release ciprofloxacin tablet formulation for treatment of uncomplicated urinary tract infection in women. Antimicrob Agents Chemother. 2005 Oct;49(10):4137-43. (InfoPOEMs: A single dose of an extended-release version of ciprofloxacin (Cipro XR) is as effective as the immediate-release version taken twice daily for 3 days. The tiny reduction in the likelihood of gastrointestinal adverse effects (number needed to treat (NNT) = 60 - 80) is likely to be heavily promoted, and must be balanced against the higher cost of this formulation. As we are given more such options, it is important to remember the key elements in choosing a drug: its safety, tolerability, efficacy, price, and simplicity. Although extended-release ciprofloxacin is simpler, it is no more effective and will almost certainly cost more. (LOE = 1b))

J Pediatr. 2006 Sep;149(3):367-372. Probiotics reduce the risk of AAD in children. For every 7 patients that would develop diarrhea while being treated with antibiotics, one fewer will develop AAD if also receiving probiotics. (InfoPOEMs: Probiotics appear to prevent antibiotic-associated diarrhea in children. However, the limited number of trials included in this study, their overall limited quality, and the potential for publication bias suggest that the data are too limited for certainty. (LOE = 1a-))
101. Rovers MM, et al. Antibiotics for **acute otitis media**: a meta-analysis with individual patient data. Lancet. 2006 Oct 21;368(9545):1429-35. Antibiotics seem to be most beneficial in children younger than 2 years of age with bilateral acute otitis media, and in children with both acute otitis media and otorrhoea. For most other children with mild disease an observational policy seems justified.
102. Del Mar CB, Glasziou PP, Spinks AB. Antibiotics for **sore throat**. Cochrane Database Syst Rev. 2006 Oct 18;(4):CD000023. Antibiotics confer relative benefits in the treatment of sore throat. However, the absolute benefits are modest. Protecting sore throat sufferers against suppurative and non-suppurative complications in modern Western society can only be achieved by treating many with antibiotics, most of whom will derive no benefit. In emerging economies (where rates of acute rheumatic fever are high, for example), the number needed to treat may be much lower for antibiotics to be considered effective. Antibiotics shorten the duration of symptoms by about sixteen hours overall.

Antibiotics substantially reduce the risk of pneumonia after chest infection, particularly in elderly people in whom the risk is highest.

Lancet. 2008 Mar 15;371(9616):908-14. Common clinical signs and symptoms cannot identify patients with rhinosinusitis for whom treatment is clearly justified. Antibiotics are not justified even if a patient reports symptoms for longer than 7-10 days.
137. Williamson IG, Rumsby K, Benge S, et al. **Antibiotics and topical nasal steroid** for treatment of **acute maxillary sinusitis**: a randomized controlled trial. JAMA. 2007 Dec 5;298(21):2487-96. Neither an antibiotic nor a topical steroid alone or in combination was effective as a treatment for acute sinusitis in the primary care setting.
138. Karageorgopoulos DE, Giannopoulou KP, Grammatikos AP, et al. Fluoroquinolones compared with beta-lactam antibiotics for the treatment of acute bacterial sinusitis: a meta-analysis of randomized controlled trials. CMAJ. 2008 Mar 25;178(7):845-54. In the treatment of **acute bacterial sinusitis**, newer fluoroquinolones conferred no benefit over beta-lactam antibiotics. The use of fluoroquinolones as first-line therapy cannot be endorsed.
139. Rajendran PM, Young D, Maurer T, Chambers H, Perdreau-Remington F, Ro P, Harris H. randomized, double-blind, placebo-controlled trial of cephalexin for treatment of **uncomplicated skin abscesses** in a population at risk for community-acquired methicillin-resistant Staphylococcus aureus infection. Antimicrob Agents Chemother. 2007 Nov;51(11):4044-8. Epub 2007 Sep 10. Simply incising and draining a superficial skin abscess is sufficient treatment and results in a very high cure rate. Adding a beta-lactam antibiotic does not improve outcomes. This is not the final word on this subject -- it is possible, although unlikely, that use of an antibiotic effective against community-acquired methicillin resistant staph aureus (CA-MRSA) would have increased the cure rate, or that this result may not apply in populations with a lower rate of CA-MRSA -- but it supports the increasingly common practice of not prescribing antibiotics following incision and drainage of a superficial skin abscess. The present systematic review, including meta-analyses for select outcomes, suggests that although individual studies vary in their findings, there is no evidence to support a consistent, clinically important impact of antibiotics in reducing the main morbid outcomes following tonsillectomy (i.e. pain, need for analgesia and secondary haemorrhage rates). Limited benefit apparent with antibiotics may be a result of positive bias introduced by several important methodological shortcomings in the included trials. Based on existing evidence therefore, we would advocate against the routine prescription of antibiotics to patients undergoing tonsillectomy. Whether a subgroup of patients who might benefit from selective administration of antibiotics exists is unknown and needs to be explored in future trials.

[ii] McFarland LV. Meta-analysis of probiotics for the prevention of antibiotic associated diarrhea & treatment of Clostridium difficile disease. Am J Gastroenterol. 2006 Apr;101(4):812-22. (see also Pharmacist's Letter July'06 and Zocco MA, et al. Efficacy of Lactobacillus GG in maintaining remission of ulcerative colitis. Aliment Pharmacol Ther. 2006 Jun 1;23(11):1567-74. InfoPOEMs: Lactobacillus rhamnosus GG (LGG) was as effective as a mesalazine product in preventing recurrence in patients with ulcerative colitis. However, the study was unblinded and a confirmatory study would be helpful. (LOE = 1b-)).(Sazawal S, Hiremath G, Dhingra U, Malik P, Deb S, Black RE. Efficacy of probiotics in prevention of acute diarrhoea: a meta-analysis of masked, randomised, placebo-controlled trials. Lancet Infect Dis. 2006 Jun;6(6):374-82. InfoPOEMs: Probiotics reduce the risk of antibiotic-associated diarrhea and other types of acute diarrhea, but not the risk of traveler's diarrhea, in both children and adults. The protective effect does not vary among different probiotic strains nor by mode of delivery. (LOE = 1a).

TOP

(Hickson M, D'Souza AL, Muthu N, et al. Use of probiotic Lactobacillus preparation to prevent diarrhoea associated with antibiotics: randomised double blind placebo controlled trial. BMJ. 2007 Jun 29; [Epub ahead of print] Consumption of a probiotic drink containing L casei, L bulgaricus, and S thermophilus can reduce the incidence of antibiotic associated diarrhoea and C difficile associated diarrhoea. This has the potential to decrease morbidity, healthcare costs, and mortality if used routinely in patients aged over 50.) (Canani RB, Cirillo P, Terrin G, Cesarano L, Spagnuolo MI, De Vincenzo A, Albano F, Passariello A, De Marco G, Manguso F, Guarino A. Probiotics for treatment of acute diarrhoea in children: randomised clinical
trial of five different preparations. BMJ. 2007 Aug 18;335(7615):340. Epub 2007 Aug 9. One day after the first probiotic administration, the daily number of stools was significantly lower (P<0.001) in children who received L rhamnosus strain GG and in those who received the probiotic mix than in the other groups. Not all commercially available probiotic preparations are effective in children with acute diarrhoea.)(Medical Letter. Probiotics. Aug 13,2007.)
Besselink MG, van Santvoort HC, et al.; Dutch Acute Pancreatitis Study Group. Probiotic prophylaxis in predicted severe acute pancreatitis: a randomised,
double-blind, placebo-controlled trial. Lancet. 2008 Feb 23;371(9613):651-9. Epub 2008 Feb 14. In patients with severe pancreatitis, probiotics were no more effective than placebo in preventing infectious complications. Furthermore, there were significantly more deaths in patients receiving probiotics. One would only need to administer probiotics to 11 patients to have 1 extra death. (LOE = 1b)

Extras

Combos to Avoid: Early virologic failure: abacavir + lamivudine (or emtricitabine) + tenofovir ; didanosine + lamivudine (or emtricitabine) + tenofovir; didanosine + tenofovir + NNRTI; didanosine + emtricitabine(lamivudine) + atazanavir; Caution: emtricitabine(or lamivudine) + tenofovir + nevirapine [69] (early virologic failure in small clinical trials; ARTEN [70] trial: may be okay)

↑SE: Didanosine + stavudine (peripheral neuropthy, pancreatitis & lactic acidosis); ATV + IDV ↑bilirubin; 2 NNRTI regimen Antagonism: stavudine + zidovudine

- Oral contraceptives + non-ritonavir boosted atazanavir (may ↑ hormone levels; ⇨use lowest dose OC)[71] or indinavir (will maintain hormone levels)

{Refractory large volume diarrhea, HIV related: octreotide (50-500mcg sc tid)[$$$] }[72,73]

Cochrane Database Syst Rev. 2010 Aug 4;8:CD008651. While ideally future research would focus on direct comparison of standard therapeutic combinations of d4T+3TC+an NNRTI and AZT+3TC+an NNRTI to compare these regimens more directly, it is unlikely that additional trials will be mounted. Observational studies should focus on understanding outcomes, including toxicity and tolerability, in low- and middle-income countries.

Tenofovir or zidovudine in three-drug combination therapy with one nucleoside reverse transcriptase inhibitor & one non-nucleoside reverse transcriptase inhibitor for initial treatment of HIV infection in antiretroviral-naïve individuals. Cochrane Database Syst Rev. 2010 Oct 6;10:CD008740. We conclude that for the critical outcomes of virologic response and serious adverse events, initial ART regimens containing TDF are equivalent to those containing AZT. However, TDF is superior to AZT in terms of immunologic response and adherence and less frequent emergence of resistance.

[6] Kiso M., Resistant influenza A viruses in children treated with oseltamivir: descriptive study. Lancet 2004; 364: 759-65. (9 of 50 treated kids had resistant gene mutations, but transmissibility unknown)

Physician's First Watch: Feb/08 A common influenza virus has developed a mutation resistant to oseltamivir (Tamiflu) has been found in U.S., Canada, & 4 European nations, the *New York Times* reports. A small percentage of **influenza A/H1N1** — the predominant flu virus infecting people this season — is affected by the **H274Y mutation**. Norway appears to be hardest hit, with 75% (12 of 16) of the isolated viruses showing **resistance to oseltamivir**. In the U.S., Britain, Denmark, and France, roughly 3% to 5% of tested viruses showed resistance (data on Canada were not provided, but reported in Pharmacy Bulletin Board Feb 4/08 at **10%**). "We don't know right now if this is a trend on the upswing or just a small blip," the CDC's chief of epidemiology and prevention told the Associated Press. Officials from the U.S. and World Health Organization told the *Times* they do not currently advise changes in Tamiflu use. In addition, the flu vaccine is still effective against the mutant virus.

Dec/08: Clinicians should remain alert for changes in recommendations that might occur as the 2008--09 influenza season progresses. Recommendations regarding the use of antiviral medications might be revised if surveillance data indicate a substantial and widespread increase in the prevalence of oseltamivir-resistant influenza viruses in the United States. In fact, the interim CDC guidance provides advice for clinicians on how to treat patients with influenza antiviral medications this season. Clinicians can use influenza test results and information, if available, about which viruses are circulating, to help decide which antiviral(s) should be used. If H1N1 viruses are circulating in the community, or it's not clear which viruses are circulating, health care providers are recommended to use an alternative antiviral, zanamivir (Relenza®), or to use combination therapy of oseltamivir and rimantadine. Use of zanamivir or dual therapy with oseltamivir and rimantadine would provide effective treatment against all circulating influenza viruses. In some instances, oseltamivir alone can still be used, such as when influenza B is diagnosed, or H1N1 viruses are not circulating.

Dharan NJ, Gubareva LV, Meyer JJ, et al. for the Oseltamivir-Resistance Working Group. Infections With Oseltamivir-Resistant Influenza A(H1N1) Virus in the United States. JAMA. 2009 Mar 2. [Epub ahead of print] Oseltamivir-resistant A(H1N1) viruses circulated widely in the United States during the 2007-2008 influenza season, appeared to be unrelated to oseltamivir use, and appeared to cause illness similar to oseltamivir-susceptible A(H1N1) viruses. Circulation of oseltamivir-resistant A(H1N1) viruses will continue, with a higher prevalence of resistance, during the 2008-2009 season.

Cochrane Database Syst Rev. 2008;1:CD002745 Our conclusions about effectiveness of both antivirals for the treatment of influenza A in children were limited to a proven benefit of RMT in the abatement of fever on day three of treatment. Due to the small number of available studies we could not reach a definitive conclusion on the safety of AMT or the effectiveness of RMT in preventing influenza in children and the elderly.

Alves Galvao MG, Rocha Crispino Santos MA, Alves da Cunha AJ. **Amantadine and rimantadine** for influenza A in children and the elderly. Cochrane Database Syst Rev. 2012 Jan 18;1:CD002745. AMT is effective in preventing influenza A in children but the NNTB is high (NNTB: 12 (95% CI 9 to 17). RMT probably helps the abatement of fever on day three of treatment, but the quality of the evidence is poor. Due to the small number of available studies, we could not reach a definitive conclusion on the safety of AMT or the effectiveness of RMT in preventing influenza in children and the elderly.

RESULTS: One hundred fifty-three influenza-associated deaths among children were reported by 40 state health departments

Bright RA, Medina MJ, Xu X, et al. Incidence of adamantane resistance among influenza A (H3N2) viruses isolated worldwide from 1994 to 2005: a cause for concern. Lancet. 2005 Oct 1;366(9492):1175-81. Epub 2005 Sep 22. FINDINGS: More than 7000 influenza A field isolates were screened for specific aminoacid substitutions in the M2 gene known to confer drug resistance. During the decade of surveillance a significant increase in drug resistance was noted, from 0.4% in 1994-1995 to 12.3% in 2003-2004. This increase in the proportion of resistant viruses was weighted heavily by those obtained from **Asia** with 61% of resistant viruses isolated since 2003 being from people in Asia. INTERPRETATION: Our data raise concerns about the appropriate use of adamantanes & draw attention to the importance of tracking the emergence and spread of drug-resistant influenza A viruses.

Bright RA, et al. Adamantane resistance among influenza A viruses isolated early during the 2005-2006 influenza season in the United States. JAMA. 2006 Feb 22;295(8):891-4. Epub 2006 Feb 2. RESULTS: A total of 209 influenza A(H3N2) viruses isolated from patients in 26 states were screened, of which 193 (92.3%) contained a change at amino acid 31 (serine to asparagine [S31N]) in the M2 gene known to be correlated with adamantane resistance. Two of 8 influenza A(H1N1) viruses contained the same mutation. Drug-resistant viruses were distributed across the United States. CONCLUSIONS: The high proportion of influenza A viruses currently circulating in the United States demonstrating adamantane resistance highlights the clinical importance of rapid surveillance for antiviral resistance. Our results indicate that these drugs should not be used for the treatment or prophylaxis of influenza in the United States until susceptibility to adamantanes has been reestablished among circulating influenza A isolates.

Cates CJ, Jefferson TO, Rowe BH. Vaccines for preventing influenza in people with **asthma**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD000364. Uncertainty remains about the degree of protection vaccination affords against asthma exacerbations that are related to influenza infection. Evidence from recently published trials indicates that there is no significant increase in asthma exacerbations immediately after vaccination (at least with inactivated influenza vaccination). There is concern regarding possible increased wheezing and hospital admissions in infants given live intranasal vaccination.

CDC Jan 2006 CDC Recommends against the Use of Amantadine and Rimantadine for the Treatment or Prophylaxis of Influenza in the United States during the 2005–06 Influenza Season http://www.cdc.gov/flu/han011406.htm (Recommendations against amantadine for influenza in 2005-06. CDC July 2009 Prevention and Control of Seasonal Influenza with Vaccines: Recommendations of the Advisory Committee on Immunization Practices (ACIP), **2009** http://www.cdc.gov/mmwr/preview/mmwrhtml/rr58e0724a1.htm ; http://www.cdc.gov/flu/

CDC Centers for Disease Control and Prevention. Updated interim recommendations — **HIV**-infected adults and adolescents: Considerations for clinicians regarding 2009 **H1N1** influenza. Oct 21 , 2009. (http://www.cdc.gov/h1n1flu/guidance_HIV.htm)

CDC data strengthen the evidence that the risk for **Guillain-Barré syndrome (GBS)** associated with the 2009 H1N1 vaccine is similar to the risk seen with seasonal flu vaccines, according to an *MMWR* report. The CDC's analysis of data from October 2009 through March 2010 found that the incidence of GBS was 1.92 per 100,000 person-years among vaccinated individuals and 1.21 per 100,000 person-years among the unvaccinated. If final data confirm this finding, the CDC says, then this would translate to 0.8 excess GBS cases for every 1 million vaccinations — a rate comparable to that found with seasonal flu vaccination. *MMWR* article (Free)

CDC **Prevention and Control of Influenza with Vaccines**. Recommendations of the Advisory Committee on Immunization Practices (ACIP), **2010**. http://www.cdc.gov/mmwr/pdf/rr/rr59e0729.pdf

CDC Preliminary Results: Surveillance for **Guillain-Barré Syndrome** After Receipt of Influenza A (H1N1) 2009 Monovalent Vaccine — United States, 2009–2010 http://www.cdc.gov/mmwr/preview/mmwrhtml/mm59e0602a1.htm Preliminary results from an analysis in EIP comparing GBS patients hospitalized through March 31, 2010, who did and did not receive 2009 H1N1 vaccination showed an estimated age-adjusted rate ratio of 1.77 (GBS incidence of 1.92 per 100,000 person-years among vaccinated persons and 1.21 per 100,000 person-years among unvaccinated persons). If end-of-surveillance analysis confirms this finding, this would correspond to 0.8 excess cases of GBS per 1 million vaccinations, similar to that found in seasonal influenza vaccines.[2,3] No other federal system to date has detected a statistically significant association between GBS and 2009 H1N1 vaccination. Surveillance and further analyses are ongoing. The 2009 H1N1 vaccine safety profile is similar to that for seasonal influenza vaccines, which have an excellent safety record. Vaccination remains the most effective method to prevent serious illness and death from 2009 H1N1 influenza infection; illness from the 2009 H1N1 influenza virus has been associated with a hospitalization rate of 222 per 1 million and a death rate of 9.7 per 1 million population.

EMA Jul 21// - European regulators have recommended restricting the use of GlaxoSmithKline's pandemic flu vaccine **Pandemrix because of a potential risk of narcolepsy** in children or adolescents. The European Medicines Agency said on Thursday that Pandemrix should only be used in people under 20 years in the absence of seasonal trivalent influenza vaccines, following its link to very rare cases of narcolepsy in young people.
Engler RJ, Nelson MR, Klote MM, et al. Walter Reed Health Care System Influenza Vaccine Consortium. **Half- vs full-dose** trivalent inactivated influenza vaccine (2004-2005): age, dose, and sex effects on immune responses. Arch Intern Med. 2008 Dec 8;168(22):2405-14. Antibody responses to intramuscular half-dose TIV in healthy, previously immunized adults were not substantially inferior to the full-dose vaccine, particularly for ages 18 to 49 years. Significantly higher geometric mean titer responses in women were identified for all ages, regardless of dose or influenza strain. Half-dose vaccination may be an effective strategy for healthy adults younger than 50 years in the setting of an influenza vaccine shortage.

FDA April /08 GlaxoSmithKline informed healthcare professionals of changes to the WARNINGS AND PRECAUTIONS sections of prescribing information for **Relenza** regarding information from postmarketing reports (mostly from Japan) of **delirium and abnormal behavior** leading to injury in patients with influenza who are receiving neuraminidase inhibitors, including Relenza. These events were reported primarily among pediatric patients and often had an abrupt onset and rapid resolution. The contribution of Relenza to these events has not been established. Influenza can be associated with a variety of neurologic and behavioral symptoms which can include seizures, hallucinations, delirium, and abnormal behavior, in some cases resulting in fatal outcomes. These events may occur in the setting of encephalitis or encephalopathy but can occur without obvious severe disease.
FDA June/10 notified consumers and healthcare professionals about a potentially harmful product represented as "**Generic Tamiflu" sold over the Internet**. FDA tests revealed that the fraudulent product does not contain Tamiflu's active ingredient, oseltamivir, but cloxacillin, an ingredient in the same class of antibiotics as penicillin.
Food and Drug Administration Oct/11 (FDA) isadvising health care professionals **not to use injector devices** to administer influenza vaccines.

Hatakeyama S, Sugaya N, Ito M, et al. Emergence of influenza B viruses with reduced sensitivity to neuraminidase inhibitors. JAMA. 2007 Apr 4;297(13):1435-42. In 1 (1.4%) of the 74 children who had received oseltamivir, we identified a variant with reduced drug sensitivity possessing a Gly402Ser neuraminidase substitution. We also identified variants with reduced sensitivity carrying an Asp198Asn, Ile222Thr, or Ser250Gly mutation in 7 (1.7%) of the 422 viruses from untreated patients. In this population, influenza B viruses with reduced sensitivity to neuraminidase inhibitors do not arise as frequently as resistant influenza A viruses. However, they appear to be transmitted within communities and families, requiring continued close monitoring.

Jefferson T, et al. Vaccines for preventing influenza in **healthy children**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD004879. Influenza vaccines are efficacious in children older than two but little evidence is available for children under two. There was a marked difference between vaccine efficacy and effectiveness. No safety comparisons could be carried out, emphasizing the need for standardisation of methods and presentation of vaccine safety data in future studies. It was surprising to find only one study of inactivated vaccine in children under two years, given current recommendations to vaccinate healthy children from six months old in the USA and Canada. If immunisation in children is to be recommended as a public health policy, large-scale studies assessing important outcomes and directly comparing vaccine types are urgently required.
Jefferson T, Jones M, Doshi P, Del Mar C. **Possible harms of oseltamivir**—a call for urgent action. Lancet. 2009 Oct 17;374(9698):1312-3.
Jefferson Tom, Jones Mark, Doshi Peter, et al. **Neuraminidase inhibitors** for preventing and treating influenza in healthy **adults**: systematic review and meta-analysis. BMJ 2009;339:b5106, doi: 10.1136/bmj.b5106 (Published 8 December 2009) . Neuraminidase inhibitors have modest effectiveness against the symptoms of influenza in otherwise healthy adults. The drugs are effective postexposure against laboratory confirmed influenza, but this is a small component of influenza-like illness, so for this outcome neuraminidase inhibitors are not effective.
Jefferson T, Di Pietrantonj C, Rivetti A, et al. **Vaccines for preventing influenza** in healthy adults. Cochrane Database Syst Rev. **2010** Jul 7;7:CD001269. Influenza vaccines have a modest effect in reducing influenza symptoms and working days lost. There is no evidence that they affect complications, such as pneumonia, or transmission.
Jefferson T, Jones MA, Doshi P, et al. Neuraminidase inhibitors for preventing and treating influenza in healthy adults and children - a review of clinical study reports. Cochrane Database of Systematic Reviews 2011, Issue 1. Art. No.: CD008965. DOI: 10.1002/14651858.CD008965. We found a high risk of publication and reporting biases in the trial programme of oseltamivir. Sub-population analyses of the influenza infected population in the oseltamivir trial programme are not possible because the two arms are non-comparable due to oseltamivir's apparent interference with antibody production. The evidence supports a direct oseltamivir mechanism of action on symptoms but we are unable to draw conclusions about its effect on complications or transmission. We expect full clinical study reports containing study protocol, reporting analysis plan, statistical analysis plan and individual patient data to clarify outstanding issues. These full clinical study reports are at present unavailable to us.

With 1 outpatient visit being prevented through vaccination of <50 children, influenza vaccination can reduce influenza-attributable medical visits in children significantly, even in years with modest vaccine efficacy.

WHO Jan 18/07 - Two people who died of bird flu in Egypt last month had a strain of the H5N1 virus that has shown moderate resistance to the frontline antiviral Tamiflu, the World Health Organization (WHO) said on Thursday. http://www.who.int/csr/disease/avian_influenza/en/index.html
WHO May 2007, New data published by the World Health Organization (WHO) has confirmed a low frequency of resistance to the flu drug Tamiflu between 2003 and 2006, Roche announced. The information, published by WHO's Neuraminidase Inhibitor Susceptibility Network, shows that resistance to Tamiflu (oseltamivir) of approximately 0.3 percent was seen during the past three influenza seasons, during which the drug was used extensively in Japan. This level of resistance is extremely low compared with the 65 percent rate seen in Japan with another antiviral, amantadine.

Zaman K, Roy E, Arifeen SE, Rahman M, Raqib R, et al.. Effectiveness of **Maternal Influenza Immunization** in Mothers and Infants. N Engl J Med. 2008 Sep 17. [Epub ahead of print] Inactivated influenza vaccine reduced proven influenza illness by 63% in infants up to 6 months of age and averted approximately a third of all febrile respiratory illnesses in mothers and young infants. Maternal influenza immunization is a strategy with substantial benefits for both mothers and infants.

WEBSITES & Updates:

Update: Influenza Activity --- United States, September 28--November 29, 2008

During September 28--November 29, 2008, influenza activity remained low in the United States. Of the few influenza viruses characterized thus far this season, **most are antigenically** related to the strains included in the 2008--09 influenza **vaccine**. Oseltamivir-resistant influenza A (H1N1) viruses have been detected, but currently available data are insufficient to predict their prevalence for the 2008--09 season. This report summarizes U.S. influenza activity* since the last update (1) and reviews new influenza vaccine recommendations for the current season. During September 28--November 29, 2008, approximately 150 World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System collaborating laboratories in the United States tested 24,657 respiratory specimens for influenza viruses; 365 (1.5%) were positive (Figure 1). Of these, 282

TOP

(77.3%) were influenza A viruses, and 83 (22.7%) were influenza B viruses. One hundred twenty-eight (45.4%) of the 282 influenza A viruses were subtyped; 112 (87.5%) of these were influenza A (H1) viruses, and 16 (12.5%) were influenza A (H3) viruses. Influenza-positive tests have been reported from 26 states in eight of the nine surveillance regions since September 28.
Enhanced surveillance for oseltamivir-resistant viruses is ongoing at CDC. Alternatives for antiviral treatment in the context of widely circulating **oseltamivir-resistant** viruses have been suggested. These treatment options, which might include preferential use of zanamivir or therapy with a combination of antivirals for certain patients, have been outlined in the ACIP 2008 influenza recommendations.†† Currently, the neuraminidase inhibitors oseltamivir and zanamivir remain the recommended medications for treatment and chemoprophylaxis of influenza. Clinicians should **remain alert for changes in recommendations** that might occur as the 2008--09 influenza season progresses. Recommendations regarding the use of antiviral medications might be revised if surveillance data indicate a substantial and widespread increase in the prevalence of oseltamivir-resistant influenza viruses in the United States. http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5749a3.htm?s_cid=mm5749a3_e

TOP

Primaquine 26.3mg tab (= 15mg base) ✗▼ PL

Terminal prophylaxis: effective against P. *vivax* & P. *ovale*. Used for pts that have had long exposure to malaria endemic areas (>8wks)[36]. Not required for travel to Haiti or the Dominican Republic as of July06 [2].

- **Chloroquine/doxycycline/mefloquine prophylaxis**: primaquine taken in conjunction with the last 2 wks of post-exposure prophylaxis, but may be taken immediately after.
- **Atovaquone/proguanil prophylaxis:** primaquine is taken during atovaquone/ proguanil post-exposure prophylaxis & then for an additional 7-14 days after.

Pediatric Dosing age >9yrs for prevention; any age for tx

Prophylaxis: 0.5 mg(base)/kg/day
Terminal Prophylaxis: 0.5 mg/kg/day x14d

Adult Dosing

Prophylaxis: 52.6 mg (30 mg base) OD $9
Terminal Proph.: 30 mg base/d x 14d $9

For prophylaxis: begin 1-2d prior to entering MRZ, continue during stay, & 1 wk after leaving

Primaquine eradicates latent parasites in the liver.

Comments

Second-line for chloroquine resistant areas

- 85- 95% effective against P. *falciparum* & P. *vivax*
- **Only therapy to prevent relapse from P. vivax & P.ovale** due to dormant hypnozoites in liver (relapse may occur within 5 years of exposure)

CI: **G6PD deficiency**/favism, pregnancy,rh. arthritis,lupus
SE: Well tolerated. GI upset; Take with food.
Missed Dose: Take next dose ASAP. However, if it is almost time for your next dose, skip the missed dose & go back to your regular dosing schedule. Do not double doses. **Take with food; not grapefruit juice**

Drug Treatment of Malaria: Tx will vary depending on species of malaria. For severe: (IV quinine or artensunate) + (Atovaquone/proguanil or doxycycline or clindamycin)

Other Investigational Drugs: **IV artesunat**e: investigational in the USA for treatement of severe malaria. {May be accessed in Canada through the Canadian Malarial Network. It is an alternative to quinine with less side effects, although limited long term experience with potential side effects from recurrent use.}

{Recent historical resistance trends: {choroquine sensitive areas: travel to **Caribbean** including Haiti and rural areas of Dominican Republic; travelers visiting resort areas not generally at risk; travel to Central America except Panama, Mexico, Argentina; parts of China / Middle east; geographic risk and resistance trends change over time.}

Approximate malaria risk (1 month stay without chemoprophylaxis): (source: CCDR 2000 Malaria Recommendations, p.3)

-	Oceania (Papua New Guinea, Irian Jaya, Solomon Islands, and Vanuatu)	1:30 or higher
-	Sub-Saharan Africa	1:50
-	Indian Subcontinent	1:250
-	Southeast Asia	1:1000
-	South America	1:2,500
-	Central America	1:10,000

- Risk also ↑'d with >6month stay, in part due to underuse of protection measures.
- Stand-By Emergency Treatment (self-admin) may be recommended in select cases.

[35]

Hydroxychloroquine PLAQUENIL,g 200mg tab

{Not used very often! Licensed for malaria in USA**}**

Second-line: chloroquine sensitive malaria

PL

- Only in chloroquine-sensitive P. *falciparum* malaria prevention

{Opthalmological exam periodically if used weekly low dose long term; risk very low in first 5yrs; if >5yrs (BMJ,CDC), or high risk (ACP)}.

Pediatric: 5 mg base/kg weekly (200 mg tab = 155 mg base) (Do not exceed adult dose)

- Adult: 400 mg **weekly**
- Begin **2 wks prior** to entering MRZ, continue during stay & **8 wks after** leaving MRZ

19

- **Caution**: pts with hepatic failure, **G6PD** deficiency, pre-existing auditory damage; psoriasis, prophyria {Pregnancy: considered safe} {May have lower retinal risk than chloroquine.}
- SE: N/V/D(↓ by giving with food or milk), pruritus, fatigue, seizures, headache & dizziness. Uncommon: alopecia, hair depigmentation, skin eruptions & seizures.
- DI: antacids, cimetidine, digoxin (increase dig level)
- Vaccine Interaction[17]: Assume same as chloroquine

Abba K, Deeks JJ, Olliaro P, et al. **Rapid diagnostic tests** for diagnosing uncomplicated *P. falciparum* malaria in endemic countries. *Cochrane Database of Systematic Reviews* 2011, Issue 7. Art. No.: CD008122. DOI: 10.1002/14651858.CD008122.pub2. The sensitivity and specificity of all RDTs is such that they can replace or extend the access of diagnostic services for uncomplicated *P. falciparum* malaria. HRP-2 antibody types may be more sensitive but are less specific than pLDH antibody-based tests, but the differences are small. The HRP-2 antigen persists even after effective treatment and so is not useful for detecting treatment failures.

Chen LH, Wilson ME, Schlagenhauf P. Controversies and misconceptions in malaria **chemoprophylaxis** for travelers. JAMA. 2007 May 23;297(20):2251-63. Despite widespread reports on the adverse effects of mefloquine, controlled studies found that serious neuropsychiatric adverse events occur at rates comparable with or lower than other chemoprophylaxis drugs. Moreover, mefloquine does not appear to impair performance while driving, flying, or diving. Vivax malaria causes significant illness in travelers, but current first-line chemoprophylaxis agents do not prevent relapses of vivax malaria. Although not licensed in most countries as primary prophylaxis, primaquine effectively prevents relapses of vivax malaria.

Enayati A, Hemingway J, Garner P. **Electronic mosquito repellents** for preventing mosquito bites and malaria infection. Cochrane Database Syst Rev. 2007 Apr 18;(2):CD005434. Field entomological studies confirm that EMRs have no effect on preventing mosquito bites. Therefore there is no justification for marketing them to prevent malaria infection.

FDA June /09 approved safety labeling revisions for chloroquine phosphate tablets (Aralen, sanofi-aventis US) to warn of the potential for serious adverse events in **nursing infants**. According to the FDA, a decision should be made whether to discontinue therapy or stop nursing, taking into account the potential clinical benefit of the drug to the mother. In a study of 11 lactating mothers, the maximum daily dose of the drug received by the breast-feeding infant was about 0.7% of the maternal start dose (600 mg base) in malaria chemotherapy. Separate chemoprophylaxis for the infant is required.

Hill N, Lenglet A, Arnéz AM, et al. Plant based **insect repellent and insecticide treated bed nets** to protect against malaria in areas of early evening biting vectors: double blind randomised placebo controlled clinical trial in the Bolivian Amazon. BMJ. 2007 Nov 17;335(7628):1023. Epub 2007 Oct 16. Insect repellents can provide protection against malaria. In areas where vectors feed in the early evening, effectiveness of treated nets can be significantly increased by using repellent between dusk and bedtime. This has important implications in malaria vector control programmes outside Africa and shows that the combined use of treated nets and insect repellents, as advocated for most tourists travelling to high risk areas, is fully justified.

Arch Intern Med. 2004 Mar 22;164(6):637-44. (Kanwar M, Brar N, Khatib R, Fakih MG. Misdiagnosis of community-acquired pneumonia and inappropriate utilization of antibiotics: side effects of the 4-h antibiotic administration rule. Chest. 2007 Jun;131(6):1865-9. Epub 2007 Mar 30. Linking antibiotic administration within 4 h of hospital admission (as a quality indicator) to financial compensation may result in an inaccurate diagnosis of CAP, inappropriate utilization of antibiotics, and thus less than optimal care.)
11. Mills GD, Oehley MR, Arrol B. Effectiveness of {beta} lactam antibiotics compared with antibiotics active against atypical pathogens in non-severe community acquired pneumonia: meta-analysis. BMJ 2005; 330:456-60. (InfoPOEMs: Strange, but true: Oral beta-lactam antibiotics -- amoxicillin, amoxicillin/clavulanate (Augmentin), or a cephalosporin -- are as effective in the treatment of community-acquired pneumonia as antibiotics active against atypical pathogens, even in patients infected with Mycoplasma pneumoniae or Chlamydia pneumoniae. These old standbys can be used instead of the more expensive drugs for most patients. Legionella infection still requires treatment with an antibiotic effective against atypical pathogens, but in these studies only 1.1% of the patients with nonsevere pneumonia had Legionella. These results are backed up by similar findings from clinical practice (Hedlund J, et al. Scand J Infect Dis 2002; 34:887-92). (LOE = 1a))
12. Carratala J, Fernandez-Sabe N, Ortega L, et al. Outpatient care compared with hospitalization for community-acquired pneumonia. Ann Intern Med 2005; 142:165-72. (Aujesky D, Auble TE, et al. Prospective comparison of three validated prediction rules for prognosis in community-acquired pneumonia. Am J Med. 2005 Apr;118(4):384-92.) (Espana PP, et al. Development and Validation of a Clinical Prediction Rule for Severe Community-acquired Pneumonia. Am J Respir Crit Care Med. 2006 Dec 1;174(11):1249-56. Epub 2006 Sep 14.)(**CURB-65**: use of CURB-65 (Confusion, Urea > 7 mmol/L, Respiratory rate ≥ 30/min, systolic blood pressure ≤ 90 mm Hg, and diastolic blood pressure ≥ 60 mm Hg, and age 65 years or older). When calculating the 30-day mortality rate, if the CURB-65 score is greater or equal to 3, the site of care should be the intensive care unit (ICU). If the score is 2, admission to a hospital is sufficient. Outpatient management is warranted when the CURB-65 score is 0 or 1.)

(The PSI may overpredict mortality in older adults. Relying on PSI, without taking into account a patients functional status, may lead to unnecessary and potentially harmful hospitalizations for pts who might otherwise have been safely treated at home ACP 2005)
14. Fuller JD, Low DE. A review of Streptococcus pneumoniae infection treatment failures associated with fluoroquinolone resistance. Clin Infect Dis. 2005 Jul 1;41(1):118-21. Epub 2005 May 26. There were 20 ciprofloxacin and levofloxacin treatment failures reported. Physicians should be aware, when treating pneumococcal respiratory tract infections in older patients with a fluoroquinolone, that clinical failures might occur, especially for patients with comorbid illnesses and a history of recent fluoroquinolone use.
15. Doern GV, Richter SS, Miller A, Miller N, Rice C, Heilmann K, Beekmann S. Antimicrobial resistance among Streptococcus pneumoniae in the United States: have we begun to turn the corner on resistance to certain antimicrobial classes? Clin Infect Dis. 2005 Jul 15;41(2):139-48. Epub 2005 Jun 7.
16. Abraham E, Laterre PF, Garg R, et al.; Administration of Drotrecogin Alfa (Activated) in Early Stage Severe Sepsis (ADDRESS) Study Group. Drotrecogin alfa (activated) for adults with severe sepsis and a low risk of death. N Engl J Med. 2005 Sep 29;353(13):1332-41. CONCLUSIONS: The absence of a beneficial treatment effect, coupled with an increased incidence of serious bleeding complications, indicates that DrotAA should not be used in patients with severe sepsis who are at low risk for death, such as those with single-organ failure or an APACHE II score less than 25.
17. Shefet D, Robenshtok E, Paul M, Leibovici L. Empirical atypical coverage for inpatients with community-acquired pneumonia: systematic review of randomized controlled trials. Arch Intern Med. 2005 Sep 26;165(17):1992-2000. CONCLUSION: Empirical antibiotic coverage of atypical pathogens in hospitalized patients with community-acquired pneumonia showed no benefit of survival or clinical efficacy in this synthesis of randomized trials.
18. D'Ignazio J, Camere MA, et al. Novel, Single-Dose Microsphere Formulation of Azithromycin versus 7-Day Levofloxacin Therapy for Treatment of Mild to Moderate Community-Acquired Pneumonia in Adults. Antimicrob Agents Chemother. 2005 Oct;49(10):4035-41. (InfoPOEMs: Although a single dose of azithromycin in an extended-release formulation was statistically similar to 7 days of levofloxacin, resistance was more common to strep pneumoniae with azithromycin and there was a trend toward worse outcomes with azithromycin using the intention-to-treat analysis. The study was also underpowered to detect clinically important differences based on the author's sample size calculations. (

Epub 2005 Nov 9. Penicillin non-susceptibility rates were stable over the study period; overall, 21.8% of isolates were resistant. Azithromycin resistance increased from 31.0% in Year 1 to 36.3% in Year 4. Resistance rates for penicillin and azithromycin varied between countries and were highest in France, Spain, South Africa, USA and the Far East. Multidrug resistance in S. pneumoniae did not change significantly over the 4 years, with an overall rate of 38.6%. Telithromycin retained good activity against S. pneumoniae (0.1% of isolates resistant), including multidrug-resistant isolates.

Cochrane Database Syst Rev. 2010 Jul 7;7:CD004875. There is insufficient evidence to draw any specific conclusions about the efficacy of antibiotics for this condition in children (although one trial suggests macrolides may be efficacious in some children with LRTI secondary to Mycoplasma). The use of antibiotics has to be balanced with possible adverse events. There is still a need for high quality, double-blinded RCTs to assess the efficacy and safety of antibiotics for LRTI secondary to M. pneumoniae in children.

165. Pugh R, Grant C, Cooke RP, et al. **Short-course** versus prolonged-course antibiotic therapy for hospital-acquired pneumonia in critically ill adults. Cochrane Database Syst Rev. 2011;(10): CD007577. We conclude that for patients with VAP not due to NF-GNB, a short fixed-course (seven or eight days) antibiotic therapy may be more appropriate than a prolonged course (10 to 15 days). Use of an individualised strategy (incorporating clinical features or serum procalcitonin) appears to safely reduce duration of antibiotic therapy for VAP.

Ochoa-Gondar O, Vila-Corcoles A, Rodriguez-Blanco T, et al. Comparison of **three predictive rules** for assessing severity in elderly patients with CAP. Int J Clin Pract. 2011 Nov;65(11):1165-72. Three prediction rules -- the Pneumonia Severity Index (PSI), CURB-65, and the modified CRB-65 -- perform equally well for predicting 30-day mortality among patients 65 years or older with community-acquired pneumonia (CAP). The simpler CRB-65, which does not require laboratory data, is particularly accurate among patients aged 65 years to 74 years. (LOE = 1b)

Defining community acquired pneumonia severity on presentation to hospital: an international derivation and validation study. Thorax. 2003 May;58(5):377-82. (Kollef KE, et al. The modified APACHE II Score outperforms CURB65 Pneumonia Severity Score as a predictor of 30day mortality in MRSA pneumonia. Chest. 2007 Oct 20). PSI: http://pda.ahrq.gov/clinic/psi/psicalc.asp
CURB-65: http://www.mdcalc.com/curb-65-severity-score-community-acquired-pneumonia

Pneumonia-Specific Severity of Illness Scoring System

Patient's Characteristics	Points Assigned	Your Pt
DEMOGRAPHIC FACTOR		
Age, yr		
Male	(age)	
Female	(age-10)	
Nursing home resident	+10	
COMORBID ILLNESS		
Neoplastic disease	+30	
Liver disease	+20	
Congestive heart failure	+10	
Cerebrovascular disease	+10	
Renal disease	+10	
PHYSICAL EXAMINATION FINDING		
Altered mental status	+20	
Respiratory rate>30/min	+20	
Systolic BP<90 mm Hg	+20	
Temperature<35ºC or>40ºC	+15	
Pulse>125/min	+10	
LABORATORY FINDING		
pH<7.35	+30	
BUN>10.7 mmol/L	+20	
Sodium<130 mmol/L	+20	
Glucose>13.9 mmol/L	+10	
Hematocrit<30%	+10	
PO_2<60mm Hg^2 or O_2 sat <90%	+10	
Pleural effusion	+10	
Total Score		

Stratification of Risk Score

Score ≤90: send home; score ≥91: admit to hospital
(possible short-course admission of those with 71-90 points)

Risk	Risk Class	Based on Algorithm	Mortality
Low	I	0 total points	~0.1%
	II	≤70 total points	~0.6%
	III	71-90 total points	~0.9-2.8%
Moderate	IV	91-130 total points	~9%
High	V	>130 total points	~28%

Above may underestimate risk in young otherwise healthy pts. May overestimate dx severity in elderly. Does not consider for example COPD, HIV or social factors.

SMART-COP

-an ICU intensive respiratory or vasopressor support (IRVS) **prediction score when CAP is confirmed on X-ray.**

	Point
-low **S**ystolic BP <90 mmHg	2
-**M**ultilobar chest Xray involvement	1
-low **A**lbumin level <3.5g/dl *	1
-high **R**espiratory rate (age adjusted)	1
-If age ≤ 50yr then ≥ 25 breaths/min	
-If age > 50yr then ≥ 30 breaths/min	
-**T**achycardia ≥ 125 beats/min	1
-**C**onfusion (new onset)	1
-poor **O**xygenation (age adjusted)	2

Age	≤ 50yr	> 50yr
PaO_2 *	< 70 mmHg	<60 mmHg
Or $O_{2\ satruation}$	≤ 93%	≤ 90 %
Or (if on O_2) PaO_2 / FiO_2 *	< 333	<250

-low arterial **p**H < 7.35 * 2

Total Score=

Interpretation: (This is not a predictor of mortality)

0-2 Points	Low risk of needing IRVS
3-4 Points	Moderate risk (1 in 8) of needing IRVS
5-6 Points	High risk (1 in 3) of needing IRVS
≥7 Points	Very high risk (2 in 3) of needing IRVS

* For primary care doctors, results for albumin, arterial pH, & PaO_2 can be overlooked & the following interpretation can be used:

0 Points	Very low risk of needing IRVS
1 Point	Low risk (1 in 20) of needing IRVS
2 Points	Moderate risk (1 in 10) of needing IRVS
3 Points	High risk (1 in 6) of needing IRVS
≥4 Points	High risk (1 in 3) of needing IRVS

(Adapted from Charles et al. Used with permission.)

Option #2:

CURB-65

1 point for Any of:

	Point
-**C**onfusion *	1
-**U**rea >7mmol/l	1
-**R**espiratory rate ≥30/min	1
-**B**lood pressure (SBP <90 or DBP≤60	1
-Age ≥65years	1
Total=	

CURB-65 Score:	0-1	2	3 or more
	Group 1	Group 2	Group 3
Mortality @30days:	Low <2%	Intermediate ~9%	High >19%
Treatment options:	Outpatient if support	Inpatient or hospital supervised outpatient	Inpatient; or ICU esp. if CURB-65 score= 4 or 5

* defined as a Mental Test Score of 8 or less, or new disorientation in person, place or time.
This scoring does **not** take into account comorbidities or extent of the pneumonia. (The CRB-65 is another version which does not incorporate the Urea into the score).

TOP

DRUGS FOR URINARY TRACT INFECTIONS (UTI)

Prepared by: Loren Regier © *www.RxFiles.ca* **Feb/10**

1. Highlights

- **Acute uncomplicated cystitis in otherwise healthy ♀**
  - Short course - **3 day** therapy – suitable for cotrimoxazole ($10), trimethoprim & fluoroquinolones (~$20)
  - Nitrofurantoin (e.g. Macrobid) – a minimum of 5-**7 days** treatment is recommended.
- **Fluoroquinolones** have excellent activity against most urinary pathogens; however concern that overuse is leading to increasing antimicrobial resistance. *Preserve them for those who really need them!*
- **Asymptomatic bacteriuria** in the institutionalized elderly is common. However, antimicrobial treatment offers no benefit and increases the prevalence of resistant bacteria. *Don't culture asymptomatic residents.*

2. Oral Antimicrobials for Urinary Tract Infections

Trimethoprim/Sulfamethoxazole or Cotrimoxazole (SMX/TMP) {Alternately consider monotherapy with Trimethoprim}

Coverage	*E. coli, P. mirabilis,. K. pneumonia, S. aureus*
Adverse effects	diarrhea, rash, hematologic abnormalities (rare); (May use trimethoprim alone in sulpha allergic patients) (other less common effects: blood dyscrasias, diarrhea, pancreatitis, nephrotoxicity, urolithiasis, hepatotoxicity, hypersensitivity reactions, skin rash, toxic epidermal necrolysis & Stevens-Johnson syndrome. In patients with AIDS, cotrimoxazole produces an increased incidence of toxicity including a syndrome of fever, malaise, nausea and headache. Cotrimoxazole is also associated with disulfiram-like reactions.)
Drug interactions	cyclosporine ↑cyclosp levels & ↑nephrotoxicity, digoxin ↑dig levels, methotrexate ↑MTX toxicity, metronidazole disulfiram reaction, phenytoin ↑phenytoin toxicity, sulfonylureas ↑hypoglycemic effect, warfarin ↑warf effect
Comments	resistance is a problem especially in recurrent UTI; average reported resistance in SK is ~15%, however, higher in some institutional situations. Other antibiotics should be used when resistance ≥20%. maintain hydration

Nitrofurantoin {Macrobid 100mg BID: well tolerated and convenient}

Coverage	*E. coli. K. pneumonia, S. aureus, Enterococcus faecalis*; (not *proteus, pseudomonas*)
Adverse effects	rash, GI upset, increased LFTs; (other less common effects: pneumonitis and other pulmonary reactions, eosinophilia, hemolytic anemia, leukopenia, agranulocytosis, methemoglobinemia, peripheral neuropathy, pseudotumor cerebri, pseudomembranous colitis, nausea, vomiting, pancreatitis, parotitis, hepatitis, systemic lupus erythematosus and cutaneous and allergic reactions)
Drug Interactions	Mg^{++} antacids ↓absorption, norfloxacin ↓norfloxacin effect; Food ↑'s absorption
Comments	maintains excellent activity against *E. coli*, *Enterococci*, & *Staph* avoid in renal dysfunction (CrCl <40-60ml/min); limited tissue penetration; not useful in complicated UTI

Ciprofloxacin {Alternately, norfloxacin & levofloxacin; not moxifloxacin as lower concentration in urine}

Coverage	*E. coli, P. mirabilis,. K. pneumonia, P. aeruginosa, +/- S. aureus* (very broad coverage & effective agent)
Adverse effects	headache, GI upset; (Other less common effects: CNS side effects, including seizures; increases in transaminases and in some cases severe and fatal hepatitis have developed. Additionally, hematuria and anaphylactic reactions have been described)
Drug Interactions	antacids ↓absorption; may use a PPI / H2-antagonist; clozapine, glyburide ↑hypoglycemia, iron ↓ cipro absorption, metoprolol ↑metop level, phenytoin ↑↓pheny levels, theophylline ↑theoph toxicity, warfarin ↑warf effect, zinc ↓cipro absorption; 1A2 substrates inhibited by ciprofloxacin & levofloxacin ∴ ↑ effect of olanzapine, haloperidol, imipramine, cyclobenzaprine, fluvoxamine, zolmitriptan…
Comments	other fluoroquinolones also effective; pseudomonal coverage with ciprofloxacin & norfloxacin. lower doses suitable for uncomplicated UTI; higher doses for complicated UTI & pyelonephritis

Amoxicillin/Clavulinic Acid (Amox/Clav)

Coverage	*E. coli, P. mirabilis, K. pneumonia, S. aureus, Enterococcus faecalis*
Adverse effects	rash, GI upset (diarrhea, more with q8h dosing ~25% formulations than with q12h formulations ~10%) (Other less common effects: eosinophilia, leukopenia and thrombocytosis; superinfections resulting in candidal vaginitis and pseudomembranous colitis may occur. Caution in patients with a sensitivity to penicillin.)
Drug Interactions	oral contraceptives ↓contraceptive effect, methotrexate ↓MTX clearance & ↑toxicity; Lab: false +'ve Coomb's test
Comments	good coverage for more resistant organisms including enterococcus.

Fosfomycin - single dose

Comments (D/C 2010) usually less effective than SMX/TMP , esp for *S. saprophiticus*; however *E. Coli* resistance uncommon

Note: other beta-lactams (amoxicillin, 1st gen cephalosporins) are alternatives although generally less effective clinically than SMX/TMP.

3. Urban Outpatient Susceptibility Patterns (SK) – local susceptibility variation should be considered

- C&S results reflect patients with recurrent/more complicated infections as these patients getting are cultured most frequently
- **Frequency & susceptibility** of pathogens found vary depending on inpatient vs outpatient and complicating factors
- **Probable organisms**: **Acute Cystitis** ⇨ *E. coli, S. saprophyticus*; **Complicated UTI** ⇨ *E. coli, Enterococci, Klebsiella, Proteus, P. aeruginosa*
  Pyelonephritis ⇨ *E. coli, Klebsiella, Enterobacter, Proteus mirabillis*; **Prostatitis** ⇨ E. coli, Gm –ve bacilli, Staph, enterococcus

E. coli (most common uropathogen):	≥83-87% S to SMX/TMP;	≥99% S to NTF;	≥94% S to Cipr; ≥82% S to Amox/Clav
Enterococcus:	Resistant to SMX/TMP	≥99% S to NTF;	≥74% S to Cipr; ≥98% S to Amp

Antibiotic prophylaxis and recurrent urinary tract infection in children. N Engl J Med. 2009 Oct 29;361(18):1748-59. Antibiotic prophylaxis reduces the likelihood of subsequent urinary tract infection (UTI; number needed to treat [NNT] = 16 for 1 year). However, subsequent infections are more likely to be caused by resistant organisms, and prophylaxis is not effective if the index infection was caused by a resistant organism. (LOE = 1b)

Fourcroy JL, et al. Efficacy and safety of a novel once-daily extended-release ciprofloxacin tablet formulation for treatment of uncomplicated urinary tract infection in women. Antimicrob Agents Chemother. 2005 Oct;49(10):4137-43. (InfoPOEMs: A single dose of an extended-release version of ciprofloxacin (Cipro XR) is as effective as the immediate-release version taken twice daily for 3 days. The tiny reduction in the likelihood of gastrointestinal adverse effects (number needed to treat (NNT) = 60 - 80) is likely to be heavily promoted, and must be balanced against the higher cost of this formulation. As we are given more such options, it is important to remember the key elements in choosing a drug: its safety, tolerability, efficacy, price, and simplicity. Although extended-release ciprofloxacin is simpler, it is no more effective and will almost certainly cost more. (LOE = 1b))

Hodson EM, et al. Antibiotics for **acute pyelonephritis in children**. Cochrane Database Syst Rev. 2007 Oct 17;(4):CD003772. These results suggest that children with acute pyelonephritis can be treated effectively with oral antibiotics (cefixime, ceftibuten and amoxycillin/clavulanic acid) or with short courses (2 to 4 days) of IV therapy followed by oral therapy. If IV therapy is chosen, single daily dosing with aminoglycosides is safe and effective.

Hooton TM, Bradley SF, Cardenas DD, et al. Diagnosis, prevention, and treatment of **catheter-associated urinary tract infection** in adults: 2009 International Clinical Practice Guidelines from the Infectious Diseases Society of America (IDSA). Clin Infect Dis. 2010 Mar 1;50(5):625-63.

Jepson RG, Craig JC. **Cranberries** for preventing urinary tract infections. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD001321. There is some evidence that cranberry juice may decrease the number of symptomatic UTIs over a 12 month period, particularly for women with recurrent UTIs. It's effectiveness for other groups is less certain. The large number of dropouts/withdrawals indicates that cranberry juice may not be acceptable over long periods of time. It is not clear what is the optimum dosage or method of administration (e.g. juice, tablets or capsules).

Kahlmeter G, Poulsen HO. Antimicrobial susceptibility of **Escherichia coli** from community-acquired urinary tract infections in **Europe**: the ECO·SENS study revisited. Int J Antimicrob Agents. 2011 Nov 2. In E. coli, resistance to mecillinam, cefadroxil (representing oral cephalosporins), nitrofurantoin, fosfomycin trometamol, gentamicin and the third-generation cephalosporins cefotaxime and ceftazidime was<2%, with the following exceptions: gentamicin in Portugal (2.8%); fosfomycin in Greece (2.9%); and cephalosporins in Austria (2.7-4.1%). Resistance levels were higher for amoxicillin/clavulanic acid (2.0-8.9%) and ciprofloxacin (0.5-7.6%) and much higher to ampicillin (21.2-34.0%), sulfamethoxazole (21.2- 31.3%), trimethoprim (14.9-19.1%) and trimethoprim/sulfamethoxazole (14.4-18.2%). Resistance to quinolones and trimethoprim increased between the ECO·SENS I (1999-2000) and ECO·SENS II (2007-2008): nalidixic acid 4.3% to 10.2%; ciprofloxacin 1.1% to 3.9%; and trimethoprim 13.3% to 16.7%. In the previous study, no isolates with extended-spectrum β-lactamase were found; however, in the present study 11 isolates were identified as having either CTX-M or AmpC.

Kallen AJ, et al. Current antibiotic therapy for isolated urinary tract infections in women. Arch Intern Med. 2006 Mar 27;166(6):635-9. CONCLUSIONS: Quinolones have surpassed sulfas as the most common class of antibiotic prescribed for isolated outpatient UTI in women. Few significant predictors of quinolone use exist, suggesting that the increase is not confined to a certain subset of patients. This pervasive growth in quinolone use raises concerns about increases in resistance to this important class of antibiotics.

Nagler EV, Williams G, Hodson EM, et al. **Interventions for primary vesicoureteric reflux.** Cochrane Database Syst Rev. 2011 Jun 15;6:CD001532. Compared with no treatment, use of long-term, low-dose antibiotics did not significantly reduce the number of repeat symptomatic and febrile UTIs in children with VUR. Considerable heterogeneity in the analyses and inclusion of only one adequately blinded study, made drawing firm conclusions challenging. Antibiotic prophylaxis significantly reduced the risk of developing new or progressive renal damage, but assuming an 8% baseline risk, 33 children would need long-term antibiotic prophylaxis to prevent one more child developing kidney damage over the course of two to three years.The added benefit of surgical or endoscopic correction of VUR over antibiotic treatment alone remains unclear. Eight children would require combined surgical and antibiotic treatment to prevent one additional child developing febrile UTI by five years, but it would not cause fewer children developing renal damage.

Pohl A. Modes of administration of antibiotics for symptomatic severe urinary tract infections. *Cochrane Database of Systematic Reviews* 2007, Issue 4. Art. No.: CD003237. DOI: 10.1002/14651858.CD003237.pub2. {Cochrane Summary: Severe urinary tract infection (UTI) is a common infection in adults and children, causing acute disease with a variety of symptoms such as fever and flank pain. This may lead to kidney damage, kidney failure or hypertension. Standard therapy involves antibiotics given at least initially by injection. This review identified 15 studies (1743 participants). The results of this review suggest oral therapy is equally effective in treating UTI and preventing long-term damage. This might reduce costs but also inconvenience for the patient.}

Richards D, Toop L, Chambers S, Fletcher L. Response to antibiotics of women with symptoms of urinary tract infection but negative dipstick urine test results: double blind randomised controlled trial. BMJ 2005; 331:143-46. (InfoPOEMs: No infection, no antibiotic, right? Maybe not. In women with dysuria and frequency but a negative urine dipstick result for nitrites and leukocytes, 3 of 4 women will respond to antibiotic treatment as compared with 1 of 4 taking placebo. The negative dipstick result correlated with culture 92% of the time. These results imply that some women have microbial infections that are not identified by dipstick or culture. Or, perhaps, the antibiotic is doing something other than killing bacteria. (LOE = 1b))

Vazquez JC, Abalos E. Treatments for symptomatic urinary tract infections during **pregnancy**. Cochrane Database Syst Rev. 2011 Jan 19;1:CD002256. Although antibiotic treatment is effective for the cure of urinary tract infections, there are insufficient data to recommend any specific drug regimen for treatment of symptomatic urinary tract infections during pregnancy. All the antibiotics studied were shown to be very effective in decreasing the incidence of the different outcomes. Complications were very rare.

White B, Diagnosis and Treatment of **Urinary Tract Infections in Children**. Am Fam Physician. 2011 Feb 15;83(4):409-415.

Williams G, Craig JC. **Long-term antibiotics for preventing recurrent urinary tract infection in children.** Cochrane Database Syst Rev. 2011 Mar 16;3:CD001534. Long-term antibiotics appear to reduce the risk of repeat symptomatic UTI in susceptible children but the benefit is small and must be considered together with the increased risk of microbial resistance.

Wing DA, Rumney PJ, Preslicka CW, Chung JH. Daily **Cranberry Juice** for the Prevention of Asymptomatic Bacteriuria in Pregnancy: A Randomized, Controlled Pilot Study. J Urol. 2008 Aug 14. n=188 These data suggest there may be a protective effect of cranberry ingestion against asymptomatic bacteriuria and symptomatic urinary tract infections in pregnancy. Further studies are planned to evaluate this effect.

Zalmanovici Trestioreanu A, Green H, Paul M, et al. Antimicrobial agents for treating **uncomplicated urinary tract infection in women**. Cochrane Database Syst Rev. 2010 Oct 6;10:CD007182. No differences were observed between the classes of antimicrobials included in this review for the symptomatic cure of acute uncomplicated UTI. Fluoroquinolones proved more effective than beta-lactams for the short-term bacteriological outcome, probably with little clinical significance. Individualised treatment should take into consideration the predictable susceptibility of urinary pathogens in local areas, possible adverse events and resistance development, and patient preference.

TOP

Treatment of Low Back Pain [21, 22]

Red Flags (assessment considerations):

- pain when recumbent
- saddle anesthesia
- pseudoclaudication
- age >55y or <20
- recent UTI
- trauma (major
- pain persisting >1mo

Tx Guidelines:

- symptomatic relief can be accomplished with OTC medication and/or spinal manipulation
- during acute phase, bed rest >4 days may further debilitate the patient
- low-stress aerobic activity & exercise OK in first 2 weeks; may delay trunk muscle exercises
- recommend return to work/normal activities as soon as possible
- if problems persist, reassessment required
- address nonphysical factors (psych/socioeconomic)

Meds: acetaminophen 1st line; NSAIDs option if necessary & not contraindicated; strong opioids may be necessary for some but consider addiction risk, use treatment agreement and set appropriate boundaries; consider referral.

Chou R, Huffman LH; American Pain Society; American College of Physicians. **Medications for acute and chronic low back pain**: a review of the evidence for an American Pain Society/American College of Physicians clinical practice guideline. Ann Intern Med. **2007** Oct 2;147(7):505-14. Medications with good evidence of short-term effectiveness for low back pain are NSAIDs, acetaminophen, skeletal muscle relaxants (for acute low back pain), and tricyclic antidepressants (for chronic low back pain). Evidence is insufficient to identify one medication as offering a clear overall net advantage because of complex tradeoffs between benefits and harms. Individual patients are likely to differ in how they weigh potential benefits, harms, and costs of various medications.

Chou R, Huffman LH; American Pain Society; American College of Physicians. **Nonpharmacologic therapies for acute and chronic low back pain**: review of the evidence for an American Pain Society/American College of Physicians clinical practice guideline. Ann Intern Med. **2007** Oct 2;147(7):492-504. Therapies with good evidence of moderate efficacy for chronic or subacute low back pain are cognitive-behavioral therapy, exercise, spinal manipulation, and interdisciplinary rehabilitation. For acute low back pain, the only therapy with good evidence of efficacy is superficial heat.

Chou R, Qaseem A, Snow V, Casey D, Cross JT Jr, Shekelle P, Owens DK; Clinical Efficacy Assessment Subcommittee of the American College of Physicians; American C

of Physicians; American Pain Society Low Back Pain Guidelines Panel. **Diagnosis and treatment of low back pain**: a joint clinical practice guideline from the American College of Physicians and the American Pain Society. Ann Intern Med. **2007** Oct 2;147(7):478-91. 1: Clinicians should conduct a focused history and physical examination to help place patients with low back pain into 1 of 3 broad categories: nonspecific low back pain, back pain potentially associated with radiculopathy or spinal stenosis, or back pain potentially associated with another specific spinal cause. The history should include assessment of psychosocial risk factors, which predict risk for chronic disabling back pain (strong recommendation, moderate-quality evidence). RECOMMENDATION 2: Clinicians should not routinely obtain imaging or other diagnostic tests in patients with nonspecific low back pain (strong recommendation, moderate-quality evidence). RECOMMENDATION 3: Clinicians should perform diagnostic imaging and testing for patients with low back pain when severe or progressive neurologic deficits are present or when serious underlying conditions are suspected on the basis of history and physical examination (strong recommendation, moderate-quality evidence). RECOMMENDATION 4: Clinicians should evaluate patients with persistent low back pain and signs or symptoms of radiculopathy or spinal stenosis with magnetic resonance imaging (preferred) or computed tomography only if they are potential candidates for surgery or epidural steroid injection (for suspected radiculopathy) (strong recommendation, moderate-quality evidence). RECOMMENDATION 5: Clinicians should provide patients with evidence-based information on low back pain with regard to their expected course, advise patients to remain active, and provide information about effective self-care options (strong recommendation, moderate-quality evidence). RECOMMENDATION 6: For patients with low back pain, clinicians should consider the use of medications with proven benefits in conjunction with back care information and self-care. Clinicians should assess severity of baseline pain and functional deficits, potential benefits, risks, and relative lack of long-term efficacy and safety data before initiating therapy (strong recommendation, moderate-quality evidence). For most patients, first-line medication options are acetaminophen or nonsteroidal anti-inflammatory drugs. RECOMMENDATION 7: For patients who do not improve with self-care options, clinicians should consider the addition of nonpharmacologic therapy with proven benefits-for acute low back pain, spinal manipulation; for chronic or subacute low back pain, intensive interdisciplinary rehabilitation, exercise therapy, acupuncture, massage therapy, spinal manipulation, yoga, cognitive-behavioral therapy, or progressive relaxation (weak recommendation, moderate-quality evidence).

Chou R, Atlas SJ, Stanos SP, Rosenquist RW. **Nonsurgical interventional therapies for low back pain**: a review of the evidence for an American Pain Society clinical practice guideline. *Spine (Phila Pa 1976)*. 2009;34(10):1078-1093.

Chou R, Fu R, Carrino JA, Deyo RA. **Imaging strategies** for low-back pain: systematic review and meta-analysis. Lancet. 2009 Feb 7;373(9662):463-72. Lumbar imaging for low-back pain without indications of serious underlying conditions does not improve clinical outcomes. Therefore, clinicians should refrain from routine, immediate lumbar imaging in patients with acute or subacute low-back pain and without features suggesting a serious underlying condition.

Chou R, Loeser JD, Owens DK,; American Pain Society (APS) Low Back Pain Guideline Panel. **Interventional therapies, surgery, and interdisciplinary rehabilitation** for low back pain: an evidence-based clinical practice guideline from the American Pain Society. Spine. 2009 May 1;34(10):1066-77. In patients with nonradicular pain: Interdisciplinary rehabilitation emphasizing cognitive-behavioral approaches should be considered for those who don't respond to usual interventions; Provocative discography (injecting material into a disc nucleus in an attempt to reproduce the patient's typical pain) is not recommended; Facet joint corticosteroid injection, prolotherapy (repeated injections of irritant material to stimulate an inflammatory response), and intradiscal corticosteroid injection are not recommended; Persistent disabling symptoms and degenerative spinal changes should prompt discussion and shared decision-making regarding surgery or interdisciplinary rehabilitation (there is insufficient evidence to weigh the use of vertebral disc replacement in these patients. In patients with persistent radiculopathy: Those with herniated discs should be offered discussion about the use of epidural steroid injection; Those with herniated discs and disabling leg pain from spinal stenosis should be offered discussion about surgery; Those with persistent pain after surgery should be offered discussion on the risks and benefits of spinal cord stimulation.

Chou Roger, Qaseem Amir, Owens Douglas K., et al. and for the Clinical Guidelines Committee of the American College of Physicians. **Diagnostic Imaging for Low Back Pain**: Advice for High-Value Health Care From the American College of Physicians. *Ann Intern Med* February 1, **2011** 154:181-189. Use an initial trial of therapy rather than immediate imaging. However, imaging is warranted when the patient has major risk factors for cancer, or shows severe or progressive neurologic deficits. Risk factors or signs of vertebral infection or the cauda equina syndrome, although rare, also warrant more immediate imaging.

Clarke J, van Tulder M, Blomberg S, et al. Traction for low-back pain with or without sciatica. Cochrane Database Syst Rev. 2005 Oct 19;4:CD003010. AUTHORS' CONCLUSIONS: The evidence suggests that traction is probably not effective.Neither continuous nor intermittent traction by itself was more effective in improving pain, disability or work absence than placebo, sham or other treatments for patients with a mixed duration of LBP, with or without sciatica. Although trials studying patients with sciatica had methodological limitations and inconsistent results, there was moderate evidence that autotraction was more effective than mechanical traction for global improvement in this population.

Dahm KT, Brurberg KG, Jamtvedt G, Hagen KB. Advice to rest in bed versus advice to stay active for acute low-back pain and sciatica. Cochrane Database Syst Rev. 2010 Jun 16;6:CD007612. Moderate quality evidence shows that patients with acute LBP may experience small benefits in pain relief and functional improvement from advice to stay active compared to advice to rest in bed; patients with sciatica experience little or no difference between the two approaches. Low quality evidence suggests little or no difference between those who received advice to stay active, exercises or physiotherapy. Further research is very likely to have an important impact on the estimate of effect and is likely to change our confidence in it.

Dionne CE, Bourbonnais R, Fremont P, et al. A clinical return-to-work rule for patients with back pain. CMAJ. 2005 Jun 7;172(12):1559-67& ACP Journal Club. Naumann M, So Y, Argoff CE, Childers MK, Dykstra DD, Gronseth GS, Jabbari B, Kaufmann HC, Schurch B, Silberstein SD, Simpson DM; Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Assessment: **Botulinum** neurotoxin in the treatment of autonomic disorders and pain (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 May 6;70(19):1707-14. Botulinum neurotoxin (BoNT) should be offered as a treatment option for the treatment of axillary hyperhidrosis and detrusor overactivity (Level A), should be considered for palmar hyperhidrosis, drooling, and detrusor sphincter dyssynergia after spinal cord injury (Level B), and may be considered for gustatory sweating and low back pain (Level C). BoNT is probably ineffective in episodic migraine and chronic tension-type headache (Level B). There is presently no consistent or strong evidence to permit drawing conclusions on the efficacy of BoNT in chronic daily headache (mainly transformed migraine) (Level U). While clinicians' practice may suggest stronger recommendations in some of these indications, evidence-based conclusions are limited by the availability of data.

Ney JP, Difazio et al. Treatment of chronic low back pain with successive injections of **botulinum toxin** a over 6 months: a prospective trial of 60 patients. Clin J Pain. 2006 May;22(4):363-9.

Nice May 2009 Low back guideline summary http://www.nice.org.uk/nicemedia/pdf/CG88QuickRefGuide.pdf (Savigny P, Watson P, Underwood M; Guideline Development Group. Early management of persistent non-specific low back pain: summary of NICE guidance. BMJ. 2009 Jun 4;338:b1805. doi: 10.1136/bmj.b1805. These guidelines from the United Kingdom's National Institute for Health and Clinical Excellence (NICE) give a nod to exercise, manual therapy, analgesics, acupuncture, and combined physical and psychological therapy for patients with low back pain. They advise against many traditional treatments, including lumbar support, traction, and steroid and other injections, citing either a lack of benefit or a lack of evidence. (LOE = 1a))

Pengel LH, Refshauge KM, Maher CG, et al. **Physiotherapist**-directed exercise, advice, or both for subacute low back pain: a randomized trial. Ann Intern Med. 2007 Jun 5;146(11):787-96. In participants with subacute low back pain, physiotherapist-directed exercise and advice were each slightly more effective than placebo at 6 weeks. The effect was greatest when the interventions were combined. At 12 months, the only effect that persisted was a small effect on participant-reported function.

Pinto RZ, Maher CG, Ferreira ML, Ferreira PH, Hancock M, Oliveira VC, et al. Drugs for relief of pain in patients with **sciatica**: systematic review and meta-analysis. BMJ 2012;344:e497.

Roelofs PD, Deyo RA, Koes BW, Scholten RJ, van Tulder MW. Nonsteroidal anti-inflammatory drugs for low back pain: an updated cochrane review. Spine. 2008 Jul 15;33(16):1766-74. The evidence from the 65 trials included in this review suggests that NSAIDs are effective for short-term symptomatic relief in patients with acute and chronic low back pain without sciatica. However, effect sizes are small. Furthermore, there does not seem to be a specific type of NSAID, which is clearly more effective than others. The selective COX-2 inhibitors showed fewer side effects compared with traditional NSAIDs in the randomized controlled trials included in this review. However, recent studies have shown that COX-2 inhibitors are associated with increased cardiovascular risks in specific patient populations.

Rubinstein SM, van Middelkoop M, Assendelft WJJ, de Boer MR, van Tulder MW. **Spinal manipulative therapy** for chronic low-back pain. *Cochrane Database of Systematic Reviews* 2011, Issue 2. Art. No.: CD008112. DOI: 10.1002/14651858.CD008112.pub2. High quality evidence suggests that there is no clinically relevant difference between SMT and other interventions

Urquhart D, et al. **Antidepressants** for non-specific **low back pain**. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD001703. There is no clear evidence that antidepressants are more effective than placebo in the management of patients with chronic low-back pain.
van Wijk RM, Geurts JW, Wynne HJ, et al. Radiofrequency denervation of lumbar facet joints in the treatment of chronic low back pain: a randomized, double-blind, sham lesion-controlled trial. Clin J Pain. 2005 Jul-Aug;21(4):335-44.
Verbeek JH, Martimo KP, Karppinen J, et al. **Manual material handling advice and assistive devices for preventing and treating back pain in workers.** Cochrane Database Syst Rev. 2011 Jun 15;6:CD005958. There is moderate quality evidence that MMH advice and training with or without assistive devices does not prevent back pain or back pain-related disability when compared to no intervention or alternative interventions. There is no evidence available from RCTs for the effectiveness of MMH advice and training or MMH assistive devices for treating back pain.
Walker BF, French SD, Grant W, Green S. **Combined chiropractic interventions** for low-back pain. Cochrane Database of Systematic Reviews 2010, Issue 4. Art. No.: CD005427. Combined chiropractic interventions slightly improved pain and disability in the short-term and pain in the medium-term for acute and subacute LBP. However, there is currently no evidence that supports or refutes that these interventions provide a clinically meaningful difference for pain or disability in people with LBP when compared to other interventions. Future research is very likely to change the estimate of effect and our confidence in the results.
Waseem Z, Boulias C, Gordon A, et al. **Botulinum toxin injections** (Botox) for low-back pain and sciatica. Cochrane Database Syst Rev. 2011 Jan 19;1:CD008257. We identified three studies that investigated the merits of BoNT for LBP, but only one had a low risk of bias and evaluated patients with non-specific LBP (N = 31).

Report of the Quality Standards Subcommittee of the American Academy of Neurology and the European Federation of Neurological Societies. Neurology. 2008 Aug 20. [Epub ahead of print] In patients with trigeminal neuralgia (TN), routine head imaging identifies structural causes in up to 15% of patients and may be considered useful (Level C). Trigeminal sensory deficits, bilateral involvement of the trigeminal nerve, and abnormal trigeminal reflexes are associated with an increased risk of symptomatic TN (STN) and should be considered useful in distinguishing STN from classic trigeminal neuralgia (Level B). There is insufficient evidence to support or refute the usefulness of MRI to identify neurovascular compression of the trigeminal nerve (Level U). Carbamazepine (Level A) or oxcarbazepine (Level B) should be offered for pain control while baclofen and lamotrigine (Level C) may be considered useful. For patients with TN refractory to medical therapy, Gasserian ganglion percutaneous techniques, gamma knife, and microvascular decompression may be considered (Level C). The role of surgery vs pharmacotherapy in the management of TN in patients with MS remains uncertain. Based upon this review of the existing evidence, patients with trigeminal neuralgia should undergo trigeminal reflex testing and be given carbamazepine. Based on weaker evidence, patients with trigeminal neuralgia that is refractory to medical therapy are likely to benefit from surgery. (LOE = 2a-)

(Wong MC, Chung JW, Wong TK. Effects of treatments for symptoms of painful diabetic neuropathy: systematic review. BMJ. 2007 Jun 11; [Epub ahead of print] Anticonvulsants and antidepressants are still the most commonly used options to manage diabetic neuropathy. Oral tricyclic antidepressants and traditional anticonvulsants are better for short term pain relief than newer generation anticonvulsants. Evidence of the long term effects of oral antidepressants and anticonvulsants is still lacking. Further studies are needed on opioids, N-methyl-D-aspartate antagonists, and ion channel blockers. (InfoPOEMs: Capsaicin and tricyclic antidepressants produce the best response in patients with short-term painful diabetic neuropathy. If these are ineffective, valproate or carbamazepine (Tegretol) should be the next choice, since they are more effective than the new anticonvulsants pregabalin (Lyrica) and gabapentin (Neurontin). Duloxetine (Cymbalta, Yentreve) and opioids also have some evidence of benefit, but not to the same degree as the other choices. (LOE = 1a)))

[38] Towheed TE, Maxwell L, Anastassiades TP, Shea B, Houpt J, Robinson V, Hochberg MC, Wells G. Glucosamine therapy for treating osteoarthritis. Cochrane Database of Systematic Reviews 2005, Issue 2. Art. No.: CD002946. DOI: 10.1002/14651858.CD002946.pub2. (Clegg et al. Glucosamine, chondroitin sulfate, and the two in combination for painful knee osteoarthritis. N Engl J Med. 2006 Feb 23;354(8):795-808. InfoPOEMs: 03May2006. **Glucosamine** This update includes 20 studies with 2570 patients. Pooled results from studies using a non-Rotta preparation or adequate allocation concealment failed to show benefit in pain and WOMAC function while those studies evaluating the Rotta preparation show that glucosamine was superior to placebo in the treatment of pain and functional impairment resulting from symptomatic OA. WOMAC outcomes of pain, stiffness and function did not show a superiority of glucosamine over placebo for both Rotta and non-Rotta preparations of glucosamine. Glucosamine was as safe as placebo. {When compared to the previous review, this review which analyzes newer studies and more high quality studies, shows there is "platinum" level evidence that pain does not improve as much when taking glucosamine for 2 to 3 months. Depending on the scale used to measure function (physical ability), function may not improve at all or as much.
Glucosamine seems to be safe}

Schumacher HR Jr, Becker MA, Wortmann RL, et al. Effects of febuxostat versus allopurinol and placebo in reducing serum urate in subjects with hyperuricemia and gout: a 28-week, phase III, randomized, double-blind, parallel-group trial. Arthritis Rheum. 2008 Nov 15;59(11):1540-8. Significantly (P < or = 0.05) higher percentages of subjects treated with febuxostat 80 mg (48%), 120 mg (65%), and 240 mg (69%) attained the primary end point of last 3 monthly serum urate levels <6.0 mg/dl compared with allopurinol (22%) and placebo (0%). At all doses studied, febuxostat more effectively lowered and maintained serum urate levels <6.0 mg/dl than did allopurinol (300 or 100 mg) or placebo in subjects with hyperuricemia and gout, including those with mild to moderately impaired renal Function.

Gelber AC. Febuxostat versus allopurinol for gout. N Engl J Med. 2006 Apr 6;354(14):1532-3; author reply 1532-3.

29 Hare JM, Mangal B, Brown J, ; OPT-CHF Investigators. Impact of oxypurinol in patients with symptomatic heart failure. Results of the OPT-CHF study. J Am Coll Cardiol. 2008 Jun 17;51(24):2301-9. Oxypurinol did not produce clinical improvements in unselected patients with moderate-to-severe heart failure. However, post-hoc analysis suggests that benefits occur in patients with elevated SUA in a manner correlating with the degree of SUA reduction. Serum uric acid may serve as a valuable biomarker to target XO inhibition in heart failure.

Reinders MK, van Roon EN, et al. Efficacy and tolerability of urate lowering drugs in gout: a randomised controlled trial of benzbromarone versus probenecid after failure of allopurinol. Ann Rheum Dis. 2008 Apr 23. [Epub ahead of print] This study demonstrates a poor efficacy and tolerability profile of allopurinol 300 mg/day to attain a biochemical predefined target level of sUr </=0.30 mmol/l after 2-months treatment. In stage 2, benzbromarone 200 mg/day is more effective and better tolerated than probenecid 2000mg/day.

Reinders MK, Haagsma C, et al.. A randomised controlled trial on the efficacy and tolerability with dose-escalation of allopurinol 300-600 mg/day versus benzbromarone 100-200 mg/day in patients with gout. Ann Rheum Dis. 2008 Jul 16. [Epub ahead of print] Increase of allopurinol dosage from 300 mg to 600 mg/day and benzbromarone dosage from 100 mg to 200 mg/day according to target sUr, gives significantly higher success rates (both 78% success in sUr </=0.30 mmol/l). No significant differences in treatment success between benzbromarone and allopurinol groups were found after dosage escalation combination in relieving pain but is associated with fewer adverse effects.

Cardiovascular Events Associated with Rofecoxib in a Colorectal Adenoma Chemoprevention Trial (**APPROVe**). *N Engl J Med 2005; 352:1092-102.* (InfoPOEMs: For every 62 patients who take rofecoxib instead of placebo for 3 years, 1 additional patient will experience a serious cardiovascular event. Remember, there is no greater symptomatic relief with COX-2 inhibitors than with older drugs; acetaminophen is a very safe alternative. The decrease in risk of serious gastrointestinal complications is marginal with COX-2 inhibitors and the cost is high. (LOE = 1b))

[19] Solomon SD, McMurray JJ, Pfeffer MA, et al. Cardiovascular Risk Associated with Celecoxib in a Clinical Trial for Colorectal Adenoma Prevention. (**APC** trial) N Engl J Med 2005; 352:1071-80. (InfoPOEMs: One additional cardiovascular event or cardiovascular death occurs for every 126 patients treated for 1 year with celecoxib. There appears to be a dose response relationship. It is difficult to justify continued use of this and other coxibs, except in the most exceptional circumstances. (LOE = 1b)) (Bertagnolli MM, Eagle CJ, Zauber AG, et al. Celecoxib for the prevention of sporadic colorectal adenomas. (APC study) N Engl J Med 2006; 355:873-884. Follow-up colonoscopies were completed at year 1 in 89.5 percent of randomized patients, and at year 3 in 75.7 percent. The estimated cumulative incidence of the detection of one or more adenomas by year 3 was 60.7 percent for patients receiving placebo, as compared with 43.2 percent for those receiving 200 mg of celecoxib twice a day (risk ratio, 0.67; 95 percent confidence interval, 0.59 to 0.77; P<0.001) and 37.5 percent for those receiving 400 mg of celecoxib twice a day (risk ratio, 0.55; 95 percent confidence interval, 0.48 to 0.64; P<0.001). Serious adverse events occurred in 18.8 percent of patients in the placebo group, as compared with 20.4 percent of those in the low-dose celecoxib group (risk ratio, 1.1; 95 percent confidence interval, 0.9 to 1.3; P=0.5) and 23.0 percent of those in the high-dose group (risk ratio, 1.2; 95 percent confidence interval, 1.0 to 1.5; P=0.06). As compared with placebo, celecoxib was associated with an increased risk of cardiovascular events (risk ratio for the low dose, 2.6; 95 percent confidence interval, 1.1 to 6.1; and risk ratio for the high dose, 3.4; 95 percent confidence interval, 1.5 to 7.9).) (Arber N, Eagle CJ, Spicak J, et al. Celecoxib for the prevention of colorectal adenomatous polyps. (PreSAP trial) N Engl J Med 2006; 355:885-895. Colonoscopies were performed at year 1 on 88.7 percent of the subjects who had undergone randomization and at year 3 on 79.2 percent. Of the 557 subjects in the placebo group and the 840 subjects in the celecoxib 400mg od group who were included in the efficacy analysis, 264 and 270, respectively, were found to have at least one adenoma at year 1, at year 3, or both. The cumulative rate of adenomas detected through year 3 was 33.6 percent in the celecoxib group and 49.3 percent in the placebo group (relative risk, 0.64; 95 percent confidence interval, 0.56 to 0.75; P<0.001). The cumulative rate of advanced adenomas detected through year 3 was 5.3 percent in the celecoxib group and 10.4 percent in the placebo group (relative risk, 0.49; 95 percent confidence interval, 0.33 to 0.73; P<0.001). Adjudicated serious cardiovascular events occurred in 2.5 percent of subjects in the celecoxib group and 1.9 percent of those in the placebo group (relative risk, 1.30; 95 percent confidence interval, 0.65 to 2.62). (Kerr DJ, Dunn JA, Langman MJ, Smith JL, Midgley RS, Stanley A, Stokes JC, Julier P, Iveson C, Duvvuri R, McConkey CC; VICTOR Trial Group. Rofecoxib and cardiovascular adverse events in adjuvant treatment of colorectal cancer. N Engl J Med. 2007 Jul 26;357(4):360-9. Rofecoxib therapy was associated with an increased frequency of adverse cardiovascular events among patients with a median study treatment of 7.4 months' duration.)

[20] Farkouh ME, Kirshner H., Harrington RA. Comparison of lumiracoxib with naproxen and ibuprofen in the Therapeutic Arthritis Research and Gastrointestinal Event Trial (**TARGET**), cardiovascular outcomes: randomised controlled trial. Lancet 2004;364:675-84. At 1-year follow-up, incidence of the primary endpoint was low, both with lumiracoxib (59 events [0.65%]) and the non-steroidal anti-inflammatory drugs (50 events [0.55%]; hazard ratio 1.14 [95% CI 0.78-1.66], p=0.5074). Incidence of myocardial infarction (clinical and silent) in the overall population in the individual substudies was 0.38% with lumiracoxib (18 events) versus 0.21% with naproxen (ten) and 0.11% with lumiracoxib (five) versus 0.16% with ibuprofen (seven).

[21] Schnitzer TJ., Burmester GR., Mysler E., Comparison of lumiracoxib with naproxen and ibuprofen in the Therapeutic Arthritis Research and Gastrointestinal Event Trial (**TARGET**), reduction in ulcer complications: randomised controlled trial. Lancet 2004;364:665-74. (18325 patients age 50 years or older with osteoarthritis were randomised to lumiracoxib 400 mg once daily (n=9156), naproxen 500 mg twice daily (4754), or ibuprofen 800 mg three times daily (4415) in two substudies of identical design. Randomisation was stratified for low-dose aspirin use and age. In patients not taking aspirin, the cumulative 1-year incidence of ulcer complications was 1.09% (95% CI 0.82-1.36) with non-steroidal anti-inflammatory drugs (64 events) versus 0.25% (95% CI 0.12-0.39) with lumiracoxib (14 events; hazard ratio 0.21 [95% CI 0.12-0.37], p<0.0001). Reductions in ulcer complications were also significant in the overall population (0.34 [0.22-0.52], p<0.0001) but not in those taking aspirin (0.79 [0.40-1.55], p=0.4876). In the overall population, 0.55% (50/9127) of those on non-steroidal anti-inflammatory drugs and 0.65% (59/9117) of those on lumiracoxib reached the cardiovascular endpoint (1.14 [0.78-1.66], p=0.5074).) (see also Pharmacists Letter Dec/06) Hawkey CJ et al. Effect of risk factors on complicated and uncomplicated ulcers in the TARGET lumiracoxib outcomes study. Gastroenterology 2007 Jul; 133:57-64. Lumiracoxib was associated with a reduced risk of ulcer complications compared with NSAIDs in all significant subgroups except aspirin users.

Long-term use of NSAIDs is associated with a reduced incidence of oral cancer (including in active smokers), but also with an increased risk of death due to cardiovascular disease. These findings highlight the need for a careful risk-benefit analysis when the long-term use of NSAIDs. (Jan/06 The Norwegian daily newspaper Dagbladet reports that a number of **statistical improbabilities** were found in the data set of the cancer trial, published in the Lancet in October last year. Lancet editor Dr Richard Horton told the BBC he would be speaking to the coauthors of the study to seek their permission to retract the paper. One example of the improbabilities" is the fact that of the 908 people in the trial, 250 shared the same birthday.)

Andersohn F, et al. Cyclooxygenase-2 Selective Nonsteroidal Anti-Inflammatory Drugs and the **Risk of Ischemic Stroke**. A Nested Case-Control Study. Stroke. 2006 May 25; [Epub ahead of print] Current use of rofecoxib (OR=1.71; 95% CI, 1.33 to 2.18), etoricoxib (OR=2.38; 95% CI, 1.10 to 5.13), but not of celecoxib (OR=1.07; 95% CI, 0.79 to 1.44) was associated with a significantly increased risk of ischemic stroke. For rofecoxib and etoricoxib, ORs tended to increase with higher daily dose and longer duration of use and were also elevated in patients without major stroke risk factors. "From the non-selective NSAIDs, diclofenac, but not ibuprofen or naproxen, was also associated with a slightly increased risk of ischemic stroke," Dr. Andersohn said.
Andersohn F, Suissa S, Garbe E. Use of first- and second-generation cyclooxygenase-2-selective nonsteroidal antiinflammatory drugs & risk of **acute myocardial infarction**. Circulation. 2006 Apr 25;113(16):1950-7. Epub 2006 Apr 17. Current use of etoricoxib was associated with a 2.09-fold (95% confidence interval [CI], 1.10 to 3.97) risk of AMI compared with no use of NSAIDs during the prior year. Current use of rofecoxib (RR=1.29; 95% CI, 1.02 to 1.63), celecoxib (RR=1.56; 95% CI, 1.22 to 2.00), and diclofenac (RR=1.37; 95% CI, 1.17 to 1.59) also significantly increased the AMI risk. For current use of valdecoxib, the RR was 4.60 (95% CI, 0.61 to 34.51). RRs appeared to increase with higher daily doses of COX-2 inhibitors and were also increased in patients without major cardiovascular risk factors.
Andrew T. Chan, MD, MPH; Edward L. et al. Long-term Use of Aspirin and Nonsteroidal Anti-inflammatory Drugs and Risk of Colorectal Cancer JAMA. 2005;294:914-923. CONCLUSIONS: Regular, long-term aspirin use reduces risk of colorectal cancer. Nonaspirin NSAIDs appear to have a similar effect. However, a significant benefit of aspirin is not apparent until more than a decade of use, with maximal risk reduction at doses greater than 14 tablets per week. These results suggest that optimal chemoprevention for colorectal cancer requires long-term use of aspirin doses substantially higher than those recommended for prevention of cardiovascular disease, but the dose-related risk of gastrointestinal bleeding must also be considered. (InfoPOEMs: Regular use of aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs), especially more than 14 doses per week for at least 10 years, reduces the risk of colon cancer while also increasing the risk of a major gastrointestinal bleeding event. All-cause mortality is not affected by regular use. We need additional methods (gene testing?) to determine who is at high risk of colorectal cancer before making specific recommendations for prevention. (LOE = 2b))

Chan AT, Ogino S, Fuchs CS. Aspirin use and survival after diagnosis of **colorectal cancer**. JAMA. 2009 Aug 12;302(6):649-58. Regular aspirin use after the diagnosis of colorectal cancer is associated with lower risk of colorectal cancer-specific and overall mortality, especially among individuals with tumors that overexpress COX-2.

Chan FKL, et al Clopidogrel versus **Aspirin and Esomeprazole** to Prevent Recurrent Ulcer Bleeding. N Engl J Med 2005;352:238-44. (InfoPOEMs: For patients with a history of bleeding peptic ulcer, the combination of aspirin and a proton pump inhibitor twice a day was safer in terms of bleeding side effects than clopidogrel. While esomeprazole was used in this study, generic omeprazole 20 mg give twice a day provides nearly the same degree of acid suppression at a much lower cost. This study calls into question the overall safety of clopidogrel, which has been promoted as not increasing the risk of bleeding significantly. (LOE = 1b))

Chan FK, et al. Preventing recurrent upper gastrointestinal bleeding in patients with Helicobacter pylori infection who are taking low-dose aspirin or naproxen. N Engl J Med. 2001 Mar 29;344(13):967-73. CONCLUSIONS: Among patients with H. pylori infection and a history of upper gastrointestinal bleeding who are taking low-dose aspirin, the eradication of H. pylori is equivalent to treatment with omeprazole in preventing recurrent bleeding. Omeprazole is superior to the eradication of H. pylori in preventing recurrent bleeding in patients who are taking other NSAIDs.

Chan FK, Wong VW, Suen BY, et al. Combination of cyclo-oxygenase-2 inhibitor **(celecoxib 200mg bid) and proton-pump inhibitor (esomeprazole 20mg bid)** for prevention of recurrent ulcer bleeding in patients at very high risk: a double-blind, randomised trial. Lancet. 2007 May 12;369(9573):1621-6. The 13-month cumulative incidence of the primary endpoint was 0% in the combined-treatment group and 12 (8.9%) in the controls (95% CI difference, 4.1 to 13.7; p=0.0004). n=441 12months. Patients at very high risk for recurrent ulcer bleeding who need anti-inflammatory analgesics should receive combination treatment with a COX 2 inhibitor and a PPI. Our findings should encourage guideline committees to review their recommendations for patients at very high risk of recurrent ulcer bleeding.

Chan CC, Reid CM, Aw TJ, Liew D, Haas SJ, Krum H. Do COX-2 inhibitors raise blood pressure more than nonselective NSAIDs and placebo? An updated meta-analysis. J Hypertens. 2009 Nov 2. [Epub ahead of print] However, this response was heterogeneous, with markedly raised BP associated with rofecoxib and etoricoxib, whereas celecoxib, valdecoxib and lumiracoxib appeared to have little BP effect.

FDA- **Acetaminophen and Liver Injury**: Q & A for Consumers 2009 http://www.fda.gov/downloads/ForConsumers/ConsumerUpdates/UCM172664.pdf
FDA Dec/09 , Endo, & Novartis revised the Hepatic Effects section of the Prescribing Information to add new warnings and precautions about the potential for elevation in liver function tests during treatment with all products (**including diclofenac gel**) on **diclofenac** sodium. In postmarketing reports, cases of drug-induced **hepatotoxicity** have been reported in the first month but can occur at any time during treatment with diclofenac. Postmarketing surveillance has reported cases of severe hepatic reactions, including liver necrosis, jaundice, fulminant hepatitis with and without jaundice, and liver failure. Some of these reported cases resulted in fatalities or liver transplantation.
FDA June/12 cautioned late last week against using **Reumofan Plus**, a dietary supplement marketed as a "natural" pain reliever for arthritis, osteoporosis, and other conditions. The drug, which is made in Mexico but available online, contains unlabeled and potentially harmful pharmaceutical ingredients: diclofenac, methocarbamol & sometimes dexamethasone.

Flossmann E, Rothwell PM; British Doctors Aspirin Trial and the UK-TIA Aspirin Trial. Effect of **aspirin on long-term risk of colorectal cancer**: consistent evidence from randomised and observational studies. Lancet. 2007 May 12;369(9573):1603-13. Use of 300 mg or more of aspirin a day for about 5 years is effective in primary prevention of colorectal cancer in randomised controlled trials, with a latency of about 10 years, which is consistent with findings from observational studies. Long-term follow-up is required from other randomised trials to establish the effects of lower or less frequent doses of aspirin.
Forman JP, Rimm EB, Curhan GC. Frequency of analgesic use and risk of hypertension among men. Arch Intern Med 2007; 167:394-399. The frequency of **nonnarcotic analgesic** use is independently associated with a moderate increase in the risk of incident **hypertension**. Given the widespread use of these medications and the high prevalence of hypertension, these results may have important public health implications.

Gaujoux-Viala C, Dougados M, Gossec L. Efficacy and safety of **steroid injections** for shoulder and elbow tendonitis: a meta-analysis of randomized controlled trials. Ann Rheum Dis. 2009 Dec;68(12):1843-9. Epub 2008 Dec 3. In the first 3 months of tendinitis of either the elbow or shoulder, injected corticosteroids are more effective than placebo or physical therapy, but no more effective than treatment with nonsteroidal anti-inflammatory drugs (NSAIDs). In the longer term they are no more effective than any treatment. What hasn't been studied is the effectiveness of steroid injections in patients for whom NSAID treatment isn't effective, since this is the usual progression of treatment of these painful conditions. (LOE = 1a-)
Gislason GH, et al. **Risk of Death or Reinfarction** Associated With the Use of Selective Cyclooxygenase-2 Inhibitors and Nonselective Nonsteroidal Antiinflammatory Drugs After Acute Myocardial Infarction. Circulation. 2006 Jun 19; [Epub ahead of print] For any use of rofecoxib, celecoxib, ibuprofen, diclofenac, and other NSAIDs, the hazard ratios and 95% confidence intervals for death were 2.80 (2.41 to 3.25; for rofecoxib), 2.57 (2.15 to 3.08; for celecoxib), 1.50 (1.36 to 1.67; for ibuprofen), 2.40 (2.09 to 2.80; for diclofenac), and 1.29 (1.16 to 1.43; for other NSAIDS); there were dose-related increases in risk of death for all of the drugs. There were trends for increased risk of rehospitalization for MI associated with the use of both the selective COX-2 inhibitors and the nonselective NSAIDs. CONCLUSIONS: Selective COX-2 inhibitors in all dosages and nonselective NSAIDs in high dosages increase mortality in patients with previous MI and should therefore be used with particular caution in these patients.

Health Canada Aug/07 reports that the Therapeutic Goods Administration (TGA), the federal regulatory authority in Australia, recently withdrew market authorization for **Prexige due to eight reports of serious liver adverse events** in Australia linked to the drug, including two deaths and two liver transplants. These adverse events were primarily with use of 200 mg and 400 mg doses daily.
Health Canada Sept/07 reports that **Qiangli Zhuanggutongbiling** has reportedly been used for joint pain and stiffness. It was found to contain the undeclared prescription drugs prednisolone acetate, cortisone acetate, piroxicam, and diclofenac.
Health Canada Sept/07: **Khun-Phra** is a health product promoted for pain relief that has been found to contain the undeclared drugs dexamethasone, prednisolone, phenylbutazone, diazepam, cyproheptadine and mebhydrolin.. **Asam Urat Flu Tulang, PJ Dewandaru** is a health product promoted to treat joint pain, rheumatism and arthritis. It has been found to contain the undeclared drugs dexamethasone, diclofenac and acetaminophen.
Health Canada Oct/07 Foreign Product Alerts: ***Zhen Feng Da Brand Xi Tong Wan*** is promoted as a pain reliever. Lot #060908 has been found to contain undeclared indomethacin, a prescription anti-inflammatory drug that should only be taken under the guidance of a health professional. ***Wellring Brand Yin Qiao Jie Du*** is a health product promoted to treat cold and flu symptoms. Lot#51005 has been found to contain undeclared acetaminophen. ***Gu Ci Dan*** and ***Xu Log Bou*** are promoted as pain relievers and have been found to contain indomethacin.
Health Canada Oct/07 is advising consumers that it has stopped the sale of the anti-inflammatory drug **Prexige** (lumiracoxib) in Canada and will cancel the drug's market authorization due to the potential for serious liver-related adverse events. (2 new severe cases in Canada)
Health Canada July/08 is advising consumers not to use 2 foreign health products due to concerns about possible side-effects: **3rd Generation In Homoeopathy Arthrit Indica Tablet**. The product is labelled for "intense joint pain." The Health Sciences Authority of Singapore has warned consumers not to use the product because it contains **nimesulide**, a pharmaceutical ingredient that has been associated with liver damage.
Health Canada Aug/08 is advising consumers not to use foreign health products due to concerns against the use of **AA Qu Feng Shu Jin Wan** because it was found to contain the undeclared pharmaceutical ingredient dexamethasone. **Obat Asam Urat** and **Asam Urat** both contained dexamethasone, phenylbutazone and piroxicam.
Health Canada June/09 is informing Canadian health care professionals and consumers of recent restrictions regarding the use of the prescription drug piroxicam. Health Canada has conducted a safety review and concluded that **piroxicam** should no longer be used to treat short-term pain and inflammation due to an increased risk of serious skin reactions and gastrointestinal problems relative to other similar drugs.
Health Canada July/09 is warning consumers not to use the unauthorized health product labelled as **Specific-Formula Arthro-Ace** as it was found to contain undeclared dexamethasone and may cause serious health effects.
Health Canada July/09 is warning that the Singapore Health Sciences Authority (HSA) warned consumers to not buy or use **Air Ikan Haruan** after it was found to contain undeclared dexamethasone. The Hong Kong Department of Health warned consumers not to buy or use the product **Neovidan** after it was found to contain undeclared prednisolone and mefenamic acid.
Health Canada Aug/09 is advising via Singapore Health Sciences Authority (HSA) that **Delima Raja Urat** contains undeclared dexamethasone, chlorpheniramine, pheniramine and sibutramine, while **Cao Gen Bai Lin Wan** contains undeclared dexamethasone and
Health Canada Aug/10 **Huo Luo Jing Dan** The Singapore Health Sciences Authority warned consumers not to buy or consume Huo Luo Jing Dan after it was found to contain undeclared indomethacin, dexamethasone and prednisolone.

TOP

Health Canada Oct/11 **Huo Li Bao and Ren Sem Tu Chon Chin Kuo Pill** - The Singapore Health Sciences Authority warned that these Chinese pain-relief products contain prescription and/or over-the-counter drugs (furosemide, piroxicam, chlorpheniramine, and/or dexamethasone).
Health Canada Dec/11 is advising Canadians that Vita Health's product, "**Compliments Muscle and Back Pain Relief Regular Strength**" contains a significant labelling error in the French dosing directions that may pose serious risks to children (less than 12 years of age).

CONCLUSION: No consistent evidence was found of enhanced safety against gastrointestinal events with any of the new cyclo-oxygenase-2 inhibitors compared with non-selective non-steroidal anti-inflammatory drugs. The use of ulcer healing drugs reduced the increased risk of adverse gastrointestinal outcomes with all groups of non-steroidal anti-inflammatory drugs, but for diclofenac the increased risk remained significant.

Hooper L, Brown TJ, Elliott R, et al. The effectiveness of **five strategies for the prevention of gastrointestinal toxicity** induced by non-steroidal anti-inflammatory drugs: systematic review. BMJ. 2004 Oct 23;329(7472):948. Epub 2004 Oct 8. CONCLUSIONS: Misoprostol, COX-2 specific and selective NSAIDs, and probably proton pump inhibitors significantly reduce the risk of symptomatic ulcers, and misoprostol and probably COX-2 specifics significantly reduce the risk of serious gastrointestinal complications, but data quality is low. More data on H2 receptor antagonists and proton pump inhibitors are needed, as is better reporting of rare but important outcomes.

TOP

5;175(12):1535-8. (InfoPOEMs: Although COX-2 inhibitors may be slightly less likely to cause gastrointestinal (GI) complications, the overall increase in the use of nonsteroidal anti-inflammatory drugs (NSAIDs) seen after their introduction appears to have led to an overall increase in the number of GI complications in the population (not to mention the thousands of cardiovascular deaths attributed to this class of drugs). Although physicians complain about prescribing restrictions, sometimes for good reason, in this case they seem to be of benefit. (LOE = 2c))

McGettigan P, Henry D. Cardiovascular Risk and Inhibition of Cyclooxygenase: A Systematic Review of the Observational Studies of Selective and Nonselective Inhibitors of Cyclooxygenase 2. JAMA. 2006 Sep 12; [Epub ahead of print] A dose-related risk was evident with rofecoxib, summary relative risk with 25 mg/d or less, 1.33 (95% confidence interval [CI], 1.00-1.79) and 2.19 (95% CI, 1.64-2.91) with more than 25 mg/d. The risk was elevated during the first month of treatment. Celecoxib was not associated with an elevated risk of vascular occlusion, summary relative risk 1.06 (95% CI, 0.91-1.23). Among older nonselective drugs, diclofenac had the highest risk with a summary relative risk of 1.40 (95% CI, 1.16-1.70). The other drugs had summary relative risks close to 1: naproxen, 0.97 (95% CI, 0.87-1.07); piroxicam, 1.06 (95% CI, 0.70-1.59); and ibuprofen, 1.07 (95% CI, 0.97-1.18). CONCLUSIONS: This review confirms the findings from randomized trials regarding the risk of cardiovascular events with rofecoxib and suggests that celecoxib in commonly used doses may not increase the risk, contradicts claims of a protective effect of naproxen, and raises serious questions about the safety of diclofenac, an older drug. (InfoPOEMs: Rofecoxib (Vioxx), diclofenac (Voltaren, Cataflam), and indomethacin (Indocin) are associated with a significant increased risk of CVD. It is likely that all NSAIDs carry some risk, but the risks may vary between medicines. Current evidence does not point to an increased risk for low dose (over the counter) ibuprofen and this remains safe to use at recommended doses. (LOE = 2a-))

Nonsteroidal anti-inflammatory drugs and cyclooxygenase-2 inhibitors for **primary prevention of colorectal cancer**: a systematic review prepared for the U.S. Preventive Services Task Force. Ann Intern Med. 2007 Mar 6;146(5):376-89. Review. Summary for patients in: Ann Intern Med. 2007 Mar 6;146(5):I35. Cyclooxygenase-2 inhibitors and NSAIDs reduce the incidence of colonic adenomas. Nonsteroidal anti-inflammatory drugs also reduce the incidence of CRC. However, these agents are associated with important cardiovascular events and gastrointestinal harms. The balance of benefits to risk does not favor chemoprevention in average-risk individuals. (InfoPOEMs: The US Preventive Services Task Force recommends against routine use of aspirin or nonsteroidal anti-inflammatory drugs (NSAIDs) to prevent colorectal cancer. The beneficial decrease in colorectal adenoma, cancer incidence, and possibly cancer-related mortality is more than offset by the harm associated with their use. Ulcers leading to gastrointestinal bleeding, renal impairment, and an increase in cardiovascular events are the main problems. (LOE = 1a))

Rostom A, Muir K, Dube C, Jolicoeur E, Boucher M, Joyce J, Tugwell P, Wells GW. Gastrointestinal safety of cyclooxygenase-2 inhibitors: a Cochrane Collaboration systematic review. Clin Gastroenterol Hepatol. 2007 Jul;5(7):818-28, 828.e1-5; quiz 768. Epub 2007Jun 6. **COX-2s appear to offer greater upper GI safety** and are better tolerated than nonselective NSAIDs. The co-administration of acetylsalicylic acid might reduce the safety advantage of COX-2s over that of nonselective NSAIDs.

OPIOID ANALGESIC: COMPARISON CHART

Extras:

- Buprenorphine Transdermal System (BuTrans Patch) Q&A – Aug 2010: http://www.rxfiles.ca/rxfiles/uploads/documents/BuTrans-QandA.pdf
- Fentanyl Nasal Spray (LAZANDA): available in USA, for cancer related breakthrough pain; 100ug/100mcL, 400ug/100mcL; time to onset =11 minutes; always start at 100ug spray, allow 2 hrs between doses, stepwise ↑ in dosage, max 4 doses in 24hrs.
- Fentanyl Sublingual Tablet (PALADIN, ProStrakan in USA): 100, 200, 300, 400, 600, 800 ug.
- Hydrocodone + Ibuprofen (REPREXAIN, VICOPROFEN, others): available in USA. (5/200, 7.5/200, 10/200 mg)
- Methadone injection (IV): available via special access program (SAP) in Canada
- Morphine + naltrexone (EMBEDA): available in USA; naltrexone added to ↓ abuse risk.
- Oxycodone: new products USA: (OXECTA), (ROXYCODONE)
- Oxycodone + Ibuprofen (COMBUNOX): available in USA. (5 / 400 mg)
- Oxymorphone (OPANA, OPANA ER): available in USA; IM, rectal, & recently oral; 3x more potent than oral morphine; avoid alcohol as ↑↑↑ peak concentrations. (IR tabs: 5,10mg; e.g 5mg q4-6h prn. ER tabs: 5, 7.5, 10,15,20,30, 40mg; e.g. 10mg q12h).
- Tapentadol (NUCYNTA): available in USA; weak mu agonist; ↑ noradrenalin (e.g. also known as norepinephrine); may have ↓ GI effects but similar CNS effects to other opioids. (50-75,100mg tabs e.g. 50mg q4-6h prn.)
- See also RxFiles Substance Abuse Chart: http://www.rxfiles.ca/rxfiles/uploads/documents/CHT-Substance-Abuse.pdf (sections: 4- Addiction screening; 5-Universal Precautions in Pain Medicine; 6-Red Flags for Aberrant Rx Drug Use)

Fentanyl Patches: "Attempting to give 1/2 patch"

The rate of medication delivery from Duragesic® patches is in proportion to the surface area of drug reservoir in contact with the skin. Prior to the availability of the 12.5 mcg/hr strength, the following procedure was occasionally used to achieve this rate:

1. An occlusive dressing like Opsite was put on the skin.
2. A 25 mcg/hr patch was then applied on top with half on the skin and half on the dressing.

This approach lacks documentation and can not be routinely recommended.

Fentanyl / Opioid Patch Exchange Tool: http://www.rxfiles.ca/rxfiles/uploads/documents/Opioid-Patch-Exchange-Disposal-Tool.pdf

Opioid Intolerance:

- **Pseudoallergy** (**COMMON**! – may use non-opioid, lower opioid dose, alternate opioid even from same class, addition of H1 $_{\text{diphenhydramine}}$ +/- H2 $_{\text{ranitiidine}}$ blocker.
  - Flushing, itching, hives, sweating, and/or mild hypotension
  - Itching, flushing or hives at injection site only
- **Potential true opioid allergy** (**RARE**! - would require change to non-opioid or opioid from different chemical class – see below)
  - Severe hypotension
  - Skin reaction other than (Flushing, itching, hives)
  - Breathing, speaking, swallowing difficulties
  - Swelling of the face, lips, mouth, tongue, pharynx or larynx

Opioid Chemical Class

1. **Phenylpiperidines**: meperidine, fentanyl, sufentanil, remifentanil
2. **Diphenylheptanes**: methadone, propoxyphene
3. **Morphine group**: morphine, codeine, hydromorphone, nalbuphine, butorphanol, levorphanol, pentazocine

New Drugs {Not yet in Canada)

- **Oral Oxymorphone**
  i. (Opana, Opana ER): **Potency** is about 10x more potent than morphine! Caution!. [Immediate release: 5, 10mg tabs; Extended release; 5, 10, 20, 40 mg tabs]

Amato L, Minozzi S, Davoli M, Vecchi S, Ferri MM, Mayet S. Psychosocial and pharmacological treatments versus pharmacological treatments for opioid detoxification. Cochrane Database Syst Rev. 2008 Oct 8;(4):CD005031. Psychosocial treatments offered in addition to pharmacological detoxification treatments are effective in terms of completion of treatment, use of opiate, results at follow-up and compliance. Although a treatment, like detoxification, that exclusively attenuates the severity of opiate withdrawal symptoms can be at best partially effective for a chronic relapsing disorder like opiate dependence, this type of treatment is an essential step prior to longer-term drug-free treatment and it is desirable to develop adjunct psychosocial approaches that might make detoxification more effective.

Australian Prescriber: Caution with Codeine: http://www.australianprescriber.com/magazine/34/5/133/5. { Codeine is a weak opioid analgesic. It has to be converted to morphine, but there is significant inter-individual variation in its pharmacokinetics which results in variable effectiveness. Codeine's efficacy in clinical trials is generally modest and while its adverse events are usually mild, serious adverse events, including death, have occurred. Tolerance and drug dependence can occur. There is a risk of toxicity especially if combination products containing codeine and other drugs are misused. Treatment with simple analgesics, or other opioids if required, provides a more predictable response.}

Carise D, Dugosh KL, McLellan AT, et al. Prescription OxyContin Abuse Among Patients Entering Addiction Treatment. Am J Psychiatry. 2007 Nov;164(11):1750-6.

CDC June/10 About one fifth of US high school students reported ever having used prescription drugs not prescribed to them, such as OxyContin, Percocet, Vicodin, Adderall, Ritalin, and Xanax. The CDC reports the first assessment of such use within the National Youth Risk Behavior Survey. In addition, prescription drug abuse was more common among white than Hispanic or black students. The agency highlighted these findings from the 2009 survey in the context of an ongoing national trend toward higher rates of nonsuicide-related overdoses and deaths associated with prescription drug abuse. 2009 National Youth Risk Behavior Survey (Free PDF)CDC news release (Free)

CDC: Centers for Disease Control and Prevention (CDC). Emergency department visits involving nonmedical use of selected prescription drugs - United States, 2004-2008. MMWR Morb Mortal Wkly Rep. 2010 Jun 18;59(23):705-9. This report describes the results of that review, which showed that the estimated number of ED visits for nonmedical use of opioid analgesics increased 111% during 2004-2008 (from 144,600 to 305,900 visits) and increased 29% during 2007-2008. The highest numbers of ED visits were recorded for oxycodone, hydrocodone, and methadone, all of which showed statistically significant increases during the 5-year period. The estimated number of ED visits involving nonmedical use of benzodiazepines increased 89% during 2004-2008 (from 143,500 to 271,700 visits) and 24% during 2007-2008.

Efficacy and safety of opioid agonists in the treatment of neuropathic pain of nonmalignant origin: systematic review and meta-analysis of randomized controlled trials. JAMA. 2005 Jun 22;293(24):3043-52. CONCLUSIONS: Short-term studies provide only equivocal evidence regarding the efficacy of opioids in reducing the intensity of neuropathic pain. Intermediate-term studies demonstrate significant efficacy of opioids over placebo for neuropathic pain, which is likely to be clinically important. Reported adverse events of opioids are common but not life-threatening. Further RCTs are needed to establish their long-term efficacy, safety (including addiction potential), and effects on quality of life.
Ehret GB, et al. Drug-Induced Long QT Syndrome in Injection Drug Users Receiving Methadone: High Frequency in Hospitalized Patients and Risk Factors. Arch Intern Med. 2006 Jun 26;166(12):1280-7.
FDA July/09 notified healthcare professionals that it is taking several actions to reduce the risk of overdose in patients using pain medications that contain propoxyphene because of data linking propoxyphene and fatal overdoses. The agency will require manufacturers of propoxyphene-containing products to strengthen the label, including the boxed warning, emphasizing the potential for overdose when using these products and to provide a medication guide to patients stressing the importance of using the drugs as directed.
FDA Nov/10 is requesting that manufacturers of the painkiller propoxyphene pull the drug from the market because of concerns over cardiotoxicity. (Propoxyphene is marketed alone as Darvon and combined with acetaminophen as Darvocet.) The agency's request is based on data showing that, even when taken at therapeutic doses, the drug can lead to potentially dangerous changes in the heart's electrical activity, including prolonged PR and QT intervals and widened QRS complex. The FDA advises clinicians to stop prescribing propoxyphene and to ask current users to discontinue the drug. FDA's MedWatch alert (Free)

Gowing L, et al. Opioid antagonists under heavy sedation or anaesthesia for opioid withdrawal. Cochrane Database Syst Rev. 2006 Apr 19;(2):CD002022. Heavy sedation compared to light sedation does not confer additional benefits in terms of less severe withdrawal or increased rates of commencement on naltrexone maintenance treatment. Given that the adverse events are potentially life-threatening, the value of antagonist-induced withdrawal under heavy sedation or anaesthesia is not supported. The high cost of anaesthesia-based approaches, both in monetary terms and use of scarce intensive care resources, suggest that this form of treatment should not be pursued.
Gowing L, Farrell M, Ali R, et al. Alpha(2)-adrenergic agonists for the management of opioid withdrawal. Cochrane Database Syst Rev. 2009 Apr 15;(2):CD002024. Clonidine and lofexidine are more effective than placebo for the management of withdrawal from heroin or methadone. No significant difference in efficacy was detected for treatment regimes based on clonidine or lofexidine, and those based on reducing doses of methadone over a period but methadone is associated with fewer adverse effects than clonidine, and lofexidine has a better safety profile than clonidine.

DOI: 10.1002/14651858.CD005364.pub2. Based on mostly descriptive analysis, topical anaesthetics are possibly an efficacious, non-invasive means of providing analgesia prior to suturing of dermal lacerations.

Falagas ME, Vouloumanou EK, Plessa E, et al. Inaccuracies in dosing drugs with teaspoons and tablespoons. Int J Clin Pract. 2010 Aug;64(9):1185-9.

FDA Jan/09 An public health advisory reminds patients and physicians of potentially serious side effects from the improper use of topical anesthetics, including lidocaine, tetracaine, benzocaine, and prilocaine. The latest advisory was prompted by a small study that tested whether lidocaine reduced discomfort during breast mammography. No serious adverse events were noted. However, the FDA remains concerned about the potential for seizures, irregular heartbeat, and breathing problems when topical anesthetics are applied over a large area or are covered by plastic wrap or a heating pad. Two deaths were previously reported in women using the anesthetics before laser hair removal.

BMJ. 2009 Jun 23;338:b2266. doi: 10.1136/bmj.b2266. Monitoring bone mineral density in postmenopausal women in the first three years after starting treatment with a potent bisphosphonate is unnecessary and may be misleading. Routine monitoring should be avoided in this early period after bisphosphonate treatment is commenced.

Cardwell CR.; Abnet CC.; Cantwell MM.; et al. Exposure to Oral Bisphosphonates and Risk of Esophageal Cancer. JAMA. 2010;304(6):657-663.
Green J, Czanner G, Reeves G, Watson J, Wise L, Beral V. Oral bisphosphonates and risk of cancer of oesophagus, stomach, and colorectum: case-control analysis within a UK primary care cohort. BMJ. 2010 Sep 1;341:c4444. doi:10.1136/bmj.c4444. The risk of oesophageal cancer increased with 10 or more prescriptions for oral bisphosphonates and with prescriptions over about a five year period. In Europe and North America, the incidence of oesophageal cancer at age 60-79 is **typically 1 per 1000** population **over five years, and this is estimated to increase to about 2 per 1000 with five years' use** of oral bisphosphonates.
FDA July/11 notified healthcare professionals and patients about its ongoing review of data from published studies to evaluate whether use of oral bisphosphonate drugs is associated with an increased risk of cancer of the esophagus. FDA has not concluded that taking an oral bisphosphonate drug increases the risk of esophageal cancer. There are insufficient data to recommend endoscopic screening of asymptomatic patients.

quartile (792 to 2000 IU daily), there was a 30% reduction in hip fracture incidence}

Bjelakovic G, Gluud LL, Nikolova D, et al. **Vitamin D** supplementation for **prevention of mortality in adults**. *Cochrane Database of Systematic Reviews* 2011, Issue 7. Art. No.: CD007470. DOI: 10.1002/14651858.CD007470.pub2. Vitamin D in the form of vitamin D3 seems to decrease mortality in predominantly elderly women who are mainly in institutions and dependent care. Vitamin D2, alfacalcidol, and calcitriol had no statistically significant effect on mortality. Vitamin D3 combined with calcium significantly increased nephrolithiasis. Both alfacalcidol and calcitriol significantly increased hypercalcaemia.

FDA Oct/10 **Atypical subtrochanteric femur fractures** are fractures in the bone just below the hip joint. Diaphyseal femur fractures occur in the long part of the thigh bone. These fractures are very uncommon and appear to account for less than 1% of all hip and femur fractures overall. Although it is not clear if bisphosphonates are the cause, these unusual femur fractures have been predominantly reported in patients taking bisphosphonates.
FDA Nov/10 has approved **denosumab** (marketed as **Xgeva**) for the prevention of fracture and bone pain in patients with cancer that has metastasized to the bone. FDA news release (Free) Xgeva prescribing information (Free PDF)
FDA July/11 notified healthcare professionals and patients about its ongoing review of data from published studies to evaluate whether use of **oral bisphosphonate** drugs is associated with an **increased risk of cancer of the esophagus**. FDA has not concluded that taking an oral bisphosphonate drug increases the risk of esophageal cancer. There are insufficient data to recommend endoscopic screening of asymptomatic patients.
FDA Sep/11 notified healthcare professionals and patients of an update to the drug label for **Reclast (zoledronic acid)** regarding the risk of kidney failure. Cases of acute renal failure requiring dialysis or having a fatal outcome following Reclast use have been reported to FDA. The revised label states that Reclast is contraindicated in

TOP

with creatinine clearance less than 35 mL/min or in patients with evidence of acute renal impairment.

Am J Prev Med. 2009 Apr;36(4):366-75. All adult patients aged >or=50 years should be evaluated for risk factors for osteoporosis. Screening with BMD testing for osteoporosis is recommended in women aged >or=65 years and in men aged >or=70 years. Younger postmenopausal women and men aged 50-69 years should undergo screening if they have at least one major or two minor risk factors for osteoporosis. It is also recommended that clinicians consider using an osteoporosis risk-assessment tool to evaluate absolute fracture risk to determine appropriate osteoporosis therapies.

Cochrane Database of Systematic Reviews 2012, Issue 5. Art. No.: CD003188. DOI: 10.1002/14651858.CD003188.pub3. Use of bisphosphonates in patients with MM reduces pathological vertebral fractures, SREs and pain. Assuming a baseline risk of 20% to 50% for vertebral fracture without treatment, between 8 and 20 MM patients should be treated to prevent vertebral fracture(s) in one patient. Assuming a baseline risk of 31% to 76% for pain amelioration without treatment, between 5 and 13 MM patients should be treated to reduce pain in one patient. With a baseline risk of 35% to 86% for SREs without treatment, between 6 and 15 MM patients should be treated to prevent SRE(s) in one patient. Overall, there were no significant adverse effects associated with the administration of bisphosphonates identified in the included RCTs. We found no evidence of superiority of any specific aminobisphosphonate (zoledronate, pamidronate or ibandronate) or nonaminobisphosphonate (etidronate or clodronate) for any outcome. However, zoledronate appears to be superior to placebo and etidronate in improving overall survival.

Screen all women aged 65 and older; screen women younger than 65 if their 10-year fracture risk is similar to or greater than that of a 65-year-old white woman without additional risk factors — roughly 9%. (The article recommends using the WHO's FRAX tool to estimate fracture risk.) The USPSTF expanded its review to include men, and concludes that there is not enough evidence to determine whether screening is beneficial or harmful

Watts NB, Diab DL. **Long-term use** of bisphosphosphonates in osteoporosis. J Clin Endocrinol Metab 2010 February 19 (Epub ahead of print).
Bisphosphonates have demonstrated antifracture efficacy in randomized, placebo-controlled trials of 3 and 4 yr duration and have been widely used since the initial release of alendronate in 1995. For zoledronic acid and risedronate, an early effect (fractures reduced within 6-12 months of starting therapy) has been shown. A sustained effect for risedronate has been shown through 5 yr and suggested through 7 yr. Ten-year data with alendronate and 8 yr data with risedronate indicated good tolerability and safety; it is unlikely that longer-term studies will be done.

TOP

RA - EXTRAS

Approach & Considerations for Drug Tx in RA

- Initial: DMARD + NSAID +/- Corticosteroid for symptoms. MTX often the DMARD of choice, however, HCQ is safer but suitable only for mild cases.
  -NSAIDs now used primarily for bridging and pain management.
  -Oral corticosteroids associated with complications, so use controversial. Short courses &/or low doses for ≤2yrs sometimes used (↓ joint pain & systemic symptoms). Intra-articular injections useful & few AEs.
  -Earlier combo DMARD or biologic tx warranted for those with high disease activity & poor prognositic factors.
  {Features of poor prognosis include: functional limitation, extraarticular disease rheumatoid nodules, RA vasculitis, Felty's syndrome, +'ve rheumatoid factor, anti-cyclic citrullinated peptide antibodies, bony erosions radiographic.}
- TNF inhibitors - 1st line biologics after an inadequate response to a DMARD. They are given +/- MTX (synergistic). Note, infliximab given with MTX (not recommended for monotherapy).
  - Initial TNF inhibitor choice: varies with clinician (often etanercept rapid onset, short t ½ or infliximab)
  - Relative to other agents, TNF-inhibitors may be more effective in relieving symptoms & limiting joint destruction. They often also act more rapidly.
  - AEs: 1) Injection site reactions (back pain, fever, urticaria, dyspnea, ↓BP): common with etanercept, golimumab, certolizumab, & adalimumab.
    2) Cytopenia: uncommon, but can occur with any anti-TNF tx. Monitor CBC.
    3) The potential for Serious Infections: (eg. bacterial sepsis, TB reactivated & disseminated, fungal, viral & opportunistic unusual eg. *p. jiroveci*) are important; screen for active infection, latent TB, etc.
    4) Malignancies (esp. lymphomas): reported but causality not established. The condition of RA ↑ lymphoma risk on its own. Avoid anti-TNF tx in patients with recent ca.
    5) Other AEs: (rare) – CHF, reversible lupus-like syndrome, demyelinating conditions eg. M.S. (avoid if hx), hepatoxicity (caution with infliximab).
  - If 1st TNF inhibitor is not effective, switching to a 2nd TNF inhibitor may be effective; however, many specialists will opt for a non-TNF biologic for a different mechanism of action.
- Non-TNF Biologics – include rituximab co-admin with a DMARD; pre-treat to prevent infusion reaction, abatacept +/- a DMARD, tocilizumab may work in ≥2wks, AEs (many; severe complications reported), anakinra less effective.
- Aggressive early therapy with MTX &/or a biologic ⇨ longer remissions, less joint destruction & improved quality of life.
- Combination Tx with 2-3 DMARDs (or a DMARD + biologic): often more effective than monotherapy without more toxicity.
  - Triple DMARD Tx: MTX +SSZ + HCQ (+/- prednisone low-dose ≤7.5-10mg/day) effective. ◆MTX + Biologic more efficatious than either alone. ◆Combination of 2+ Biologics NOT recommended as ↑ toxicity!
- Comorbidity & biologics ACR RA 2012:
  - 1) Hepatitis: a) Hep C ⇨ potentially recommend etanercept;
    b) Hep B: untreated chronic or treated chronic with Child-Pugh class B or higher: avoid any biologic!
  - 2) Malignancy: a) treated solid malignancy >5yrs or non-melanoma skin ca >5ys ago – recommend any biologic;
    b) treated solid malignancy <5yr or treated non-melanoma skin ca within 5yr – recommend rituximab;
    c) treated skin melanoma, & treated lymphoproliferative malignancy – recommend rituximab;
  - 3) CHF: a) NYHA class III-IV with ejection fraction ≤50%: avoid anti-TNF biologics!

Vaccinations: before DMARD or biologic, immunize for influenza, pneumococcal, hep-B & HZV. Live vaccines should not be given to patients on biologics (should be given ≥1 month prior to starting tx).

Pain Management in RA:

- Neuromodulators: Cochrane Review RCT, placebo controlled - few trials, all short term (~2-5 weeks) with high risk of bias (ie. Weak evidence)
  1) Nefopam (ACUPAN): not in Canada; 5HT, NE & DA receptor blocking; NNT=2 for pain relief, offset by significant SE's
  2) Topical capsaicin: reasonable add-onn option; NNT=2-3 for pain relief, offset by some burning at application site
  3) Oromucosal cannabis: small reduction in pain, highly offset by SE's leading to withdrawal (NNH=3) including dizziness 26%, dry mouth 13% & lightheadedness (10%)
  4) Lack of data for other agents included: anticonvulsants, ketamine, bupropion, methylphenidate

FDA July/10 will require that the label for the rheumatoid arthritis drug **leflunomide (Arava)** carry an added warning for severe liver injury. The label already warns against the drug's use in pregnant women and those of childbearing potential. The new warning comes after the FDA received **49 reports of severe liver injury**, including 14 instances of fatal liver failure, from 2002 to 2009. Risk for liver injury was higher among patients using other drugs associated with liver injury and patients with liver disease. Clinicians should monitor liver enzymes at least monthly for 3 months after beginning the drug. After that, enzymes should be monitored every quarter. Treatment should be halted if liver enzymes rise to two times the upper limit of normal. http://www.fda.gov/Safety/MedWatch/SafetyInformation/SafetyAlertsforHumanMedicalProducts/ucm218912.htm

FDA Sep/11 notified healthcare professionals that the Boxed Warning for the entire class of **Tumor Necrosis Factor-alpha (TNFα) blockers** has been updated to include the risk of infection from two bacterial pathogens, **Legionella and Listeria**. In addition, the Boxed Warning and Warnings and Precautions sections of the labels for all of the TNFα blockers have been revised so that they contain consistent information about the risk for serious infections and the associated disease-causing pathogens.

Clinical and radiographic outcomes of **four different treatment strategies in patients with early rheumatoid arthritis (the BeSt study)**: A randomized, controlled trial. Arthritis Rheum. 2005 Nov;52(11):3381-90. CONCLUSION: In patients with early RA, initial combination therapy including either prednisone or infliximab resulted in earlier functional improvement and less radiographic damage after 1 year than did sequential monotherapy or step-up combination therapy. (Goekoop-Ruiterman YP, de Vries-Bouwstra JK, Allaart CF, et al. Comparison of treatment strategies in early rheumatoid arthritis: a randomized trial (BeSt). Ann Intern Med. 2007 Mar 20;146(6):406-15. Currently available antirheumatic drugs can be highly effective in patients with early rheumatoid arthritis in a setting of tight disease control. Initial combination therapies seem to provide earlier clinical improvement and less progression of joint damage, but all treatment strategies eventually showed at 2yrs similar clinical improvements. In addition, combination therapy can be withdrawn successfully and less treatment adjustments are needed than with initial monotherapies.)

Hjardem E, Ostergaard M, Podenphant J, et al.. Do rheumatoid arthritis patients in clinical practice benefit from **switching from infliximab to a second tumor necrosis factor** alpha inhibitor? Ann Rheum Dis. 2007 Sep;66(9):1184-9. Epub 2007 Mar 27. Lack of efficacy switchers had a better clinical response to the second treatment. Adverse effect switchers responded equally well to both treatments, with a low risk of discontinuing the second drug as a result of AE. Drug survival of the switchers' second biological therapy was higher than of the first, but lower than that of non-switchers. No difference between various sequences of drugs were found. Danish post-marketing data thus support that RA patients may benefit from switching biological therapy.

Kane S, Ford J, Cohen R, Wagner C. **Absence of Infliximab in Infant Sera and Breast Milk** From Nursing Mothers Receiving Therapy for Crohn's Disease Before and After Delivery. J Clin Gastroenterol. 2009 Jan 12. [Epub ahead of print]n=3. Infliximab was detected in the mothers' sera, but not in the breast milk of nursing mothers or in the sera of the breast-fed newborns. Data from this small series of patients suggest that infliximab was not transferred from mother to child, either in utero or through breast milk. These data suggest that mothers receiving infliximab should not be discouraged from nursing their children.

Singh JA, Beg S, Lopez-Olivo MA. **Tocilizumab** for rheumatoid arthritis. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008331. Tocilizumab is beneficial in decreasing RA disease activity and improving function. Tocilizumab treatment was associated with significant increase in cholesterol levels and in total adverse events. Larger safety studies are needed to address these safety concerns.
Singh JA, Wells GA, Christensen R, et al. **Adverse effects of biologics**: a network meta-analysis and Cochrane overview. Cochrane Database of Systematic Reviews 2011, Issue 2. Art. No.: CD008794. DOI: 10.1002/14651858.CD008794.pub2. Overall, in the short term biologics were associated with significantly higher rates of total adverse events, withdrawals due to adverse events and TB reactivation. Some biologics had a statistically higher association with certain adverse outcomes compared to control, but there was no consistency across the outcomes so caution is needed in interpreting these results.

Solomon DH, Avorn J, Katz JN, et al. **Immunosuppressive medications** and hospitalization for **cardiovascular events** in patients with rheumatoid arthritis. Arthritis Rheum. 2006 Nov 29;54(12):3790-3798. Monotherapy with oral glucocorticoids was associated with an increased risk of cardiovascular events (OR 1.5, 95% CI 1.1 - 2.1), and a similar trend in the direction of risk was seen with glucocorticoid combination therapy (OR 1.3, 95% CI 0.8-2.0). Cytotoxic immunosuppressive agents other than MTX (azathioprine, cyclosporine, and leflunomide) were also associated with an increased risk of cardiovascular events (with both monotherapy and combination treatment, OR 1.8, 95% CI 1.1-3.0). When compared with RA patients receiving MTX monotherapy, those receiving biologic immunosuppressive agents had neither an increased nor decreased risk of experiencing a cardiovascular event, whereas use of oral glucocorticoids and cytotoxic immunosuppressive agents was associated with significant increases in the risk of cardiovascular events.

[38] Ronald C. Petersen, Ph.D., M.D., Ronald G. Thomas, Ph.D., Michael Grundman, M.D., M.P.H., et al., for the Alzheimer's Disease Cooperative Study Group Vitamin E & Donepezil for the Treatment of **Mild Cognitive Impairment.** N Engl J Med 2005 June 9;352:2379-88. (Conclusions: Vitamin E had no benefit in patients with mild cognitive impairment. Although donepezil therapy was associated with a lower rate of progression to Alzheimer's disease during the first 12 months of treatment, the rate of progression to Alzheimer's disease after three years was not lower among patients treated with donepezil than among those given placebo.) (InfoPOEMs: Vitamin E does not slow progression of mild cognitive impairment to full-fledged Alzheimer's disease. Donepezil provides an early benefit that is gone by 3yr. A secondary analysis found that donepezil appeared more beneficial for pts with the apolipoprotein E4 (APOE) gene. This finding requires prospective confirmation before we begin to test all pts with mild cognitive impairment for APOE & use it to guide therapy.(LOE = 1b))

[75] June 2005 Health Canada & April 2005 FDA Issues Public Health Advisory for Antipsychotic Drugs used for Treatment of Behavioral Disorders in Elderly Patients
http://www.fda.gov/bbs/topics/ANSWERS/2005/ANS01350.html http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/2005/2005_63_e.html (Singh S, Wooltorton E. Increased mortality among elderly patients with dementia using atypical antipsychotics. CMAJ. 2005 Aug 2;173(3):252.) (Medical Letter August 1,2005 -Atypical antipsychotics in the Elderly FDA n=5106 17 RCTs mortality rate of 4.5% with atypical antipsychotic therapy vs 2.6% with placebo, most deaths were due to cardiovascular & infectious causes such as pneumonia.) Schneider LS, Dagerman KS, Insel P. Risk of death with atypical antipsychotic drug treatment for dementia: meta-analysis of randomized placebo-controlled trials. JAMA. 2005 Oct 19;294(15):1934-43. (InfoPOEMs: The use of atypical antipsychotic drugs for even short periods (less than 8 to 12 weeks) is associated with a significantly increased risk of death. Antipsychotic drugs should be used only in individual situations of an identifiable risk of harm and when alternate therapies have failed. (LOE = 1a)){15 trials (9 unpublished) of atypical antipsychotics vs placebo for ~10-12weeks n=5110; 3.5 vs 2.3% death rate}(Wang PS et al. Risk of Death in Elderly Users of Conventional vs Atypical Antipsychotic Medications. N Engl J Med 2005;353:2335-41. Conclusion: If confirmed, these results suggest that conventional antipsychotic medications are at least as likely as atypical agents to increase the risk of death among elderly persons and that conventional drugs should no be used to replace atypical agents discontinued in response to the FDA warning. (InfoPOEMs: It seems reasonable to conclude that conventional and atypical antipsychotic agents are both associated with an increased risk of death in elderly pts. The limitations of this study do not allow us to confidently conclude that older agents are less safe than newer agents, though. (LOE = 2b))) (Schneeweiss S, Setoguchi S, Brookhart A, Dormuth C, Wang PS. Risk of death associated with the use of conventional versus atypical antipsychotic drugs among elderly patients. CMAJ. 2007 Feb 27;176(5):627-32. Among elderly patients, the risk of death associated with conventional antipsychotic medications is comparable to and possibly greater than the risk of death associated with atypical antipsychotic medications. Until further evidence is available, physicians should consider all antipsychotic medications to be equally risky in elderly patients.) (Gill SS, Bronskill SE, Normand SL, Anderson GM, Sykora K, Lam K, Bell CM, Lee PE, Fischer HD, Herrmann N, Gurwitz JH, Rochon PA. Antipsychotic drug use and mortality in older adults with dementia. Ann Intern Med. 2007 Jun 5;146(11):775-86. Atypical antipsychotic use is associated with an increased risk for death compared with nonuse among older adults with dementia. The risk for death may be greater with conventional antipsychotics than with atypical antipsychotics.)
Knol W, van Marum RJ, Jansen PA, et al. Antipsychotic Drug Use and Risk of **Pneumonia** in Elderly People. J Am Geriatr Soc. 2008 Feb 7; [Epub ahead of print] Use of antipsychotics in elderly people is associated with greater risk of pneumonia. This risk is highest shortly after the initiation of treatment, with the greatest increase in risk found for atypical antipsychotics.
FDA Conventional Antipsychotic Warning June/08 http://www.fda.gov/cder/drug/InfoSheets/HCP/antipsychotics_conventional.htm
Rochon PA, Normand SL, et al. Antipsychotic therapy and short-term **serious events** in older adults with dementia. Arch Intern Med. 2008 May 26;168(10):1090-6. Relative to those who received no antipsychotic therapy, community-dwelling older adults newly dispensed an **atypical antipsychotic therapy were 3.2 times** more likely (95% confidence interval, 2.77-3.68) and those who received **conventional antipsychotic therapy were 3.8 times** more likely (95% confidence interval, 3.31-4.39) to develop any serious event during the 30 days of follow-up. The pattern of serious events was similar but less pronounced among older adults living in a nursing home. Serious events, as indicated by a hospital admission or death, are frequent following the short-term use of antipsychotic drugs in older adults with dementia. Antipsychotic drugs should be used with caution even when short-term therapy is being prescribed.
Douglas IJ, Smeeth L. Exposure to antipsychotics and risk of stroke: self controlled case series study. BMJ. 2008 Aug 28;337:a1227. doi: 10.1136/bmj.a1227. **All antipsychotics are associated with an increased risk of stroke**, and the risk might be higher in patients receiving atypical antipsychotics than those receiving typical antipsychotics. People with dementia seem to be at a higher risk of an associated stroke than people without dementia and use of antipsychotics should, when possible, be avoided in these patients.
Valiyeva E, Herrmann N, Rochon PA, Gill SS, Anderson GM. Effect of regulatory warnings on antipsychotic prescription rates among elderly patients with dementia: a population-based time-series analysis. CMAJ. 2008 Aug 26;179(5):438-46.

TOP

[Epub ahead of print] There is an increased long-term risk of mortality in patients with AD who are prescribed antipsychotic medication; these results further highlight the need to seek less harmful alternatives for the long-term treatment of neuropsychiatric symptoms in these patients.

Ray WA, Chung CP, Murray KT et al. Atypical antipsychotic drugs and the risk of **sudden cardiac death**. New Engl J Med 2009; 360: 225-235. Both typical and atypical antipsychotic drugs increase the risk of sudden cardiac death. The absolute risk of sudden cardiac death in patients taking these drugs is 1.8 per 100 persons taking the drugs for 10yrs, which is approximately twice as high as for patients in the general population. Newer drugs are not safer than older drugs with respect to cardiovascular outcomes, & thioridazine, clozapine, & risperidone in high doses appear to be slightly more risky. (LOE = 2b)

Rossom RC, Rector TS, Lederle FA, et al. Are All Commonly Prescribed Antipsychotics Associated with Greater **Mortality** in Elderly Male Veterans with Dementia? J Am Geriatr Soc. 2010 May 7.

Commonly prescribed doses of haloperidol, olanzapine, and risperidone, but not quetiapine, were associated with a short-term increase in mortality.

[76] Hien le TT, Cumming RG, Cameron ID, et al. Atypical antipsychotic medications and **risk of falls** in residents of aged care facilities. J Am Geriatr Soc. 2005 Aug;53(8):1290-5. CONCLUSION: Despite fewer extrapyramidal side effects, atypical antipsychotic medications are not associated with fewer falls than the older, more-established antipsychotics.

[77] Schneider LS, Tariot PN, Dagerman KS, et al. **CATIE-AD** Study Group. Effectiveness of atypical antipsychotic drugs in patients with Alzheimer's disease. N Engl J Med. 2006 Oct 12;355(15):1525-38. (n=421 36weeks risperidone 1mg/d, olanzapine 5.5mg/d, & quetiapine 56.5mg/d) Adverse effects offset advantages in the efficacy of atypical antipsychotic drugs for the treatment of psychosis, aggression, or agitation in patients with Alzheimer's disease. There were no significant differences among treatments with regard to the time to the discontinuation of treatment for any reason: olanzapine (median, 8.1 weeks), quetiapine (median, 5.3 weeks), risperidone (median, 7.4 weeks), and placebo (median, 8.0 weeks) (P=0.52). The median time to the discontinuation of treatment due to a lack of efficacy favored olanzapine (22.1 weeks) and risperidone (26.7 weeks) as compared with quetiapine (9.1 weeks) and placebo (9.0 weeks) (P=0.002). The time to the discontinuation of treatment due to adverse events or intolerability favored placebo. Overall, 24% of patients who received olanzapine, 16% of patients who received quetiapine, 18% of patients who received risperidone, & 5% of patients who received placebo discontinued their assigned treatment owing to intolerability (P=0.009). No significant differences were noted among the groups with regard to improvement on the CGIC scale. Improvement was observed in 32% of patients assigned to olanzapine, 26% of patients assigned to quetiapine, 29% of patients assigned to risperidone, and 21% of patients assigned to placebo (P=0.22). (InfoPOEMs: Atypical antipsychotics are minimally, if at all, effective for patients with Alzheimer's disease (AD), and they have significant adverse effects. They should not be routinely used for the treatment of psychosis, agitation, or aggression in these patients. (LOE = 1b))

[78] Lee PE, Gill SS, Freedman M, Bronskill SE, Hillmer MP, Rochon PA. **Atypical antipsychotic** drugs in the treatment of behavioural and psychological symptoms of dementia: systematic review. BMJ. 2004 Jul 10;329(7457):75. CONCLUSIONS: Although atypical antipsychotic drugs are being used with increasing frequency, few randomised trials have evaluated their use for BPSD. Limited evidence supports the perception of improved efficacy and adverse event profiles compared with typical antipsychotic drugs.

Komossa K, Rummel-Kluge C, Schwarz S, et al. Risperidone versus other atypical antipsychotics for schizophrenia. Cochrane Database Syst Rev. 2011 Jan 19;1:CD006626. Risperidone seems to produce somewhat more extrapyramidal side effects and clearly more prolactin increase than most other SGAs. It may also differ from other compounds in efficacy and in the occurrence of other adverse effects such as weight gain, metabolic problems, cardiac effects, sedation and seizures. Nevertheless, the large proportion of participants leaving studies early and incomplete reporting of outcomes makes it difficult to draw firm conclusions.

Seitz DP, Adunuri N, Gill SS, et al. Antidepressants for agitation and psychosis in dementia. Cochrane Database Syst Rev. 2011 Feb 16;2:CD008191. Currently there are relatively few studies of antidepressants for the treatment of agitation and psychosis in dementia. The SSRIs sertraline and citalopram were associated with a reduction in symptoms of agitation when compared to placebo in two studies. Both SSRIs and trazodone appear to be tolerated reasonably well when compared to placebo, typical antipsychotics and atypical antipsychotics.

Lonergan E, Luxenberg J, Areosa Sastre A, Wyller TB. **Benzodiazepines** for delirium. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD006379. No adequately controlled trials could be found to support the use of benzodiazepines in the treatment of non-alcohol withdrawal related delirium among hospitalised patients, and at this time benzodiazepines cannot be recommended for the control of this condition. Because of the scarcity of trials with randomization of patients, placebo control, and adequate concealment of allocation of subjects, it is clear that further research is required to determine the role of benzodiazepines in the treatment of non-alcohol withdrawal related delirium.

Malouf R, Grimley Evans J. **Folic acid with or without vitamin B12** for the prevention & treatment of healthy elderly and demented people. Cochrane Database Syst Rev. 2008 Oct 8;(4):CD004514. The small number of studies which have been done provide no consistent evidence either way that folic acid, with or without vitamin B12, has a beneficial effect on cognitive function of unselected healthy or cognitively impaired older people. In a preliminary study, folic acid was associated with improvement in the response of people with Alzheimer`s disease to cholinesterase inhibitors. In another, long-term use appeared to improve the cognitive function of healthy older people with high homocysteine levels. More studies are needed on this important issue.

Cochrane Database of Systematic Reviews 2011, Issue 1. Art. No.: CD006220. DOI: 10.1002/14651858.CD006220.pub2. There is evidence that cognitive interventions do lead to performance gains but none of the effects observed could be attributable specifically to cognitive training, as the improvements observed did not exceed the improvement in active control conditions. This does not mean that longer, more intense or different interventions might not be effective, but that those which have been reported thus far have only limited effect. We therefore suggest more standardized study protocols in order to maximize comparability of studies and to maximize the possibility of data pooling - also in other cognitive domains than memory.

McGuinness B, Todd S, Passmore P, Bullock R. The effects of blood pressure lowering on development of cognitive impairment & dementia in patients without apparent prior cerebrovascular disease. Cochrane Database Syst Rev. 2006 Apr 19;(2):CD004034. There was no convincing evidence from the trials identified that blood pressure lowering prevents the development of dementia or cognitive impairment in hypertensive patients with no apparent prior cerebrovascular disease. There were significant problems identified with analysing the data, however, due to the number of patients lost to follow-up and the number of placebo patients given active treatment. This introduced bias. More robust results may be obtained by analysing one year data to reduce differential drop-out or by conducting a meta- analysis using individual patient data.

McGuinness B, O`Hare J, Craig D, et al. Statins for the treatment of dementia. Cochrane Database Syst Rev. 2010 Aug 4;8:CD007514. There is insufficient evidence to recommend statins for the treatment of dementia. Analysis from the studies available, including one large RCT, indicate statins have no benefit on the outcome measures ADAS-Cog or MMSE. We need to await full results from CLASP 2008 before we can be certain.

DOI:10.1002/14651858.CD006929.pub2. The delivery of FA has been incorporated within wide ranging multi-component programmes and study designs have varied according to setting - i.e. family care, care homes and hospital, with surprisingly few studies located in care homes. Our findings suggest potential beneficial effects of multi-component interventions, which utilise FA. Whilst functional analysis for challenging behaviour in dementia care shows promise, it is too early to draw conclusions about its efficacy.

Mukundan A, Faulkner G, Cohn T, Remington G. **Antipsychotic switching** for people with schizophrenia who have neuroleptic-induced **weight or metabolic problems**. Cochrane Database of Systematic Reviews 2010, Issue 12. Art. No.: CD006629. DOI: 10.1002/14651858.CD006629.pub2. Evidence from this review suggests that switching antipsychotic medication to one with lesser potential for causing weight gain or metabolic problems could be an effective way to manage these side effects, but the data were weak due to the limited number of trials in this area and small sample sizes. Poor reporting of data also hindered using some trials and outcomes. There was no difference in mental state, global state and other treatment related adverse events between switching to another medication and continuing on the previous one. When the three switching strategies were compared none of them had an advantage over the others in their effects on the primary outcomes considered in this review. Better designed trials with adequate power would provide more convincing evidence for using medication switching as an intervention strategy.

A randomized, double-blind, placebo-controlled study of **aripiprazole** (~9mg/d) for the treatment of psychosis in nursing home patients with Alzheimer disease. Am J Geriatr Psychiatry. 2008 Jul;16(7):537-50. n=256 10weeks. In nursing home residents with AD and psychosis, aripiprazole did not confer specific benefits for the treatment of psychotic symptoms; but psychological and behavioral symptoms, including agitation, anxiety, and depression, were improved with aripiprazole, with a low risk of AEs.

Sudeep S Gill, Paula A Rochon, Nathan Herrmann, et al. Atypical antipsychotic drugs and **risk of ischaemic stroke**: population based retrospective cohort study BMJ, doi:10.1136/bmj.38330.470486.8F (published 24 January 2005) CONCLUSION: Older adults with dementia who take atypical antipsychotics have a similar risk of ischaemic stroke to those taking typical antipsychotics.

El-Tawil S, Al Musa T, Valli H, et al. Quinine for muscle cramps. Cochrane Database Syst Rev. 2010 Dec 8;12:CD005044. There is moderate quality evidence that quinine significantly reduces cramp frequency, intensity and cramp days in dosages between 200 and 500 mg/day. There is moderate quality evidence that with use up to 60 days, the incidence of serious adverse events is not significantly greater than for placebo in the identified trials. Further research is required on the optimal dose and duration of use, and also on alternative treatments.
Gao X, Schwarzschild MA, Wang H, Ascherio A. Obesity and restless legs syndrome in men and women. Neurology. 2009 Apr 7;72(14):1255-61. Both overall and abdominal adiposity are associated with increased likelihoods of having restless legs syndrome (RLS).

Pucci E, Giuliani G, Solari A, Simi S, Minozzi S, Di Pietrantonj C, Galea I. **Natalizumab** for relapsing remitting multiple sclerosis. Cochrane Database of Systematic Reviews 2011, Issue 10. Art. No.: CD007621. DOI: 10.1002/14651858.CD007621.pub2. Although one trial did not contribute to efficacy results due to its duration, we found robust evidence in favour of a reduction in relapses and disability at 2 years in RRMS patients treated with NTZ. The drug was well tolerated. There are current significant safety concerns due to reporting of an increasing number of PML cases in patients treated with NTZ. This review was unable to provide an up-to-date systematic assessment of the risk due to the maximum 2 year-duration of the trials included. An independent systematic review of the safety profile of NTZ is warranted. NTZ should be used only by skilled neurologists in MS centres under surveillance programs.

(Yousry TA, Major EO, Ryschkewitsch C, et al. Evaluation of patients treated with natalizumab for progressive multifocal leukoencephalopathy. N Engl J Med. 2006 Mar 2;354(9):924-33.) (May 3, 2007 - Biogen Idec (NASDAQ: BIIB) and Elan Corporation, plc (NYSE: ELN) announced today that new data from the TOUCH Prescribing Programä and TYGRIS safety study confirm the safety profile from previous clinical studies of TYSABRI® (natalizumab). Also presented at the 59th annual meeting of the American Academy of Neurology in Boston, MA were extension study data that showed that TYSABRI has a sustained treatment effect on clinical relapses and the risk of disability progression in multiple sclerosis (MS) patients treated for up to three years. The companies recently reported that as of mid-April 2007 approximately 12,500 patients have been prescribed TYSABRI worldwide. The companies estimate that in both commercial use and clinical trials, there are currently over 10,000 patients on TYSABRI therapy worldwide. No New PML Cases 10 Months After Tysabri Allowed Back on Market. The drug is currently being used by more than 10,00 patients worldwide -- including roughly 6600 in the U.S. -- the manufacturer said.) July 31/08 Biogen, Elan Report Brain Infections in Patients Shares of Biogen Idec Inc. and Elan Corp. fell sharply in late trading Thursday, after the companies said their multiple sclerosis drug Tysabri has been linked to **two new cases** of a rare and often fatal brain inflammation.
Goodin DS, Cohen BA, O'Connor P, Kappos L, Stevens JC; Therapeutics and Technology Assessment Subcommittee of the **American Academy of Neurology**. Assessment: the use of natalizumab (Tysabri) for the treatment of multiple sclerosis (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 Sep 2;71(10):766-73. The **PML** risk in a pooled clinical trial cohort has been estimated to be 1 person for every 1,000 patients treated for an average of 17.9 months, although this figure could change in either direction with more experience with the drug.
December 17, 2008 — Biogen Idec and Élan reported to the United States Securities and Exchange Commission (SEC) that "relevant regulatory agencies" had been informed of another case of progressive multifocal leukoencephalopathy (PML) with natalizumab (Tysabri) monotherapy in a patient with multiple sclerosis (MS). The case was found through surveillance, the companies note, and the patient is stable. The male patient is from Germany and had been on natalizumab monotherapy for 26 months. He is reported to be stable and under the care of his physician. The companies released information on their December 11 Form 8-K report to the SEC December 15.

FDA Sep/09 documents 13 PML cases http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/ucm107198.htm
October 27, 2009 — The European Medicines Agency (EMEA) disclosed October 23 that it has begun a review of the risk–benefit balance for use of natalizumab (*Tysabri*, Biogen Idec/Elan) in relapsing-remitting multiple sclerosis in light of new cases of progressive multifocal leukoencephalopathy (PML) with treatment. The EMEA notes it started a review of the benefits and risks of natalizumab because reports of PML cases worldwide have climbed now to 23 since the drug was reinstated in the market in 2006. "This review is initiated to discuss any additional measures necessary to ensure the safe use of Tysabri and how to balance the risks to the patients against the benefits of the treatment," a press release from EMEA notes. The release was a round-up of EMEA activities as of October 2009. Natalizumab was taken off the market in February 2005 after the first 3 cases of PML were reported. On September 23, 2009, th

Drug Administration (FDA) reported that the count for confirmed cases of PML worldwide in patients treated with natalizumab as monotherapy had reached 13. They have now confirmed the new total case count at 23.
Jan 21,2010 (Dow Jones)--As of Wednesday, there have been 31 cases of a rare brain infection in multiple sclerosis patients on Tysabri, sold by Biogen Idec Inc. (BIIB) and Elan Corp. (ELN), according to a review by a European regulatory panel. The European Medicines Agency's Committee for Medicinal Products for Human Use, known as CHMP, reported the cases of progressive multifocal leukoencephalopathy, or PML, in a review of the drug that concluded its rewards outweigh its risks and the drug should stay on the market. Of the **31 cases**, 23 of the patients were on the drug for more than two years, which puts the infection rate at about 1 in 1,000 patients for those exceeding that duration. This assertion is the same held by the company and implied by the drug's label.
FDA Feb/10 notified healthcare professionals and patients that the risk of developing progressive multifocal leukoencephalopathy (PML) increases with the number of Tysabri infusions received. This new safety information, based on reports of 31 confirmed cases of PML received by the FDA as of January 21, 2010, will now be included in the Tysabri drug label and patient *Medication Guide*.
March 18, 2010 9:22 AM EDT Biogen Idec (Nasdaq: BIIB) disclosed that the number of PML cases involving those taking its Tysabri drug has increased to 42 patients with 9 who have died.
May/10 Biogen Idec Canada Inc., has updated the Tysabri product information with new information on Progressive Multifocal Leukoencephalopathy (PML). The risk of PML increases with increasing duration of treatment with Tysabri. After 24 infusions, physicians are to review with their patients, the benefits and risk of continuing Tysabri treatment.
Schröder A, Lee DH, Hellwig K, Lukas C, Linker RA, Gold R. **Successful Management of Natalizumab**-Associated Progressive Multifocal Leukoencephalopathy and Immune Reconstitution Syndrome in a Patient With Multiple Sclerosis. Arch Neurol. 2010 Jul 12.
Oct 22/10 - Two more patients taking Biogen Idec Inc's multiple sclerosis drug Tysabri (natalizumab) have developed progressive multifocal leukoencephalopathy (PML), the company said on Wednesday. The Cambridge, Massachusetts-based biotechnology company said in its latest monthly update that as of Oct. 1, there have been **70 confirmed cases of PML**, up from 68 as of Sept. 2. Of those, 14 have died and 56 are alive with varying degrees of disability ranging from mild to severe. There were no additional deaths in October. As of June 30, about 71,400 patients had received Tysabri since it was launched.
Vermersch P, Kappos L, Gold R, et al. Clinical outcomes of natalizumab-associated progressive multifocal leukoencephalopathy. Neurology. 2011 May 17;76(20):1697-704.
FDA Jan/12 JC virus is common and usually harmless, the agency said, but its presence — along with either of the other two PML risk factors — can be dangerous in patients taking immunomodulating drugs like natalizumab. The other risk factors are treatment with natalizumab for longer than 2 years, and previous treatment with immunosuppressant drugs such as methotrexate or cyclophosphamide. The FDA estimates that patients with all three risk factors face about a 1% risk for PML (11 cases per 1000 patients treated).

[Epub ahead of print] Treatment with HiCy (50 mg/kg/d for 4 consecutive days) was safe and well tolerated in our patients with MS. Patients experienced (n=9) a pronounced reduction in disease activity and disability after HiCy treatment. This immunoablative regimen of cyclophosphamide for patients with aggressive MS is worthy of further study and may be an alternative to bone marrow transplantation.
Makhani N, Gorman MP, Branson HM, et al. **Cyclophosphamide** therapy in pediatric multiple sclerosis. Neurology. 2009 May 13. Cyclophosphamide is an option for the treatment of children with aggressive multiple sclerosis refractory to first-line therapies. Recommendations regarding patient selection, treatment administration, and monitoring are discussed.
[75] Casetta I ; Iuliano G ; Filippini G. **Azathioprine** for multiple sclerosis. **Cochrane** Database Syst Rev. 2007; (4):CD003982 (ISSN: 1469-493X) {Azathioprine is an appropriate maintenance treatment for patients with multiple sclerosis who frequently relapse and require steroids. Cumulative doses of 600 g should not be exceeded in relation to a possible increased risk of malignancy. Considering the trade off between the benefits and harms, azathioprine is a fair alternative to interferon beta for treating multiple sclerosis. A logical next step for future trials would seem the direct comparison of azathioprine and interferon beta. In fact the direct comparison between these two widely used treatments in multiple sclerosis has not been made.}
[76] Giovannoni G, Comi G, Cook S, et al. the **CLARITY** Study Group, A Placebo-Controlled Trial of Oral Cladribine for Relapsing Multiple Sclerosis. N Engl J Med 2010 0: NEJMoa0902533. (n=1326, 96 weeks, 3.5 or 5.25mg/kg)
For cladribine versus placebo, the relative risk reduction in the annualized relapse rate was 57.6% for the group receiving 3.5 mg per kilogram of body weight and 54.5% for those receiving 5.25 mg per kilogram. Adverse effects were similar in all three trials of cladribine and fingolimod, and rates of events leading to discontinuation of a study drug were low but still at least twice as frequent with high-dose cladribine (7.9% for the 5.25-mg dose) and fingolimod (10% and 14% for the 1.25-mg dose). Side effects: herpetic infections, ?cancer & lymphocytopenia.
Giovannoni G, Cook S, Rammohan K, et al; on behalf of the **CLARITY** study group. Sustained disease-activity-free status in patients with relapsing-remitting multiple sclerosis treated with **cladribine** tablets in the CLARITY study: a post-hoc and subgroup analysis. Lancet Neurol. 2011 Mar 10.
June 22/11, Merck Serono announced that, in light of feedback from regulatory authorities, the company would **no longer pursue a global approval process for cladribine tablets (Movectro)** for the treatment of relapsing-remitting MS & indeed would withdraw the drug from Australia and Russia, where it already had achieved approval.

[82] Cohen, JA., Barkhof F, Comi G, et al., **TRANSFORMS** Study, Oral **Fingolimod** or Intramuscular Interferon for Relapsing Multiple Sclerosis. N Engl J Med 2010 0: NEJMoa0907839 (n=1292, 1yr, 1.25 or 0.5mg po od vs 30ug IM/wk)
Kappos L, Radue EW, O'Connor P et al. **FREEDOMS** Study, A Placebo-Controlled Trial of Oral **Fingolimod** in Relapsing Multiple Sclerosis. N Engl J Med 2010 0: NEJMoa0909494.. (n=1272, 2yr, 1.25 or 0.5mg po od vs placebo)
For fingolimod versus placebo, the relative risk reduction was 54% for the 0.5-mg dose and 60% for the 1.25-mg dose. For fingolimod versus interferon beta-1a, the relative risk reduction was 52% for the 0.5-mg dose and 39% for the 1.25-mg dose. Adverse effects were similar in all three trials of cladribine and fingolimod, and rates of events leading to discontinuation of a study drug were low but still at least twice as frequent with high-dose cladribine (7.9% for the 5.25-mg dose) and fingolimod (10% and 14% for the 1.25-mg dose). Side effects: herpetic infections, ?cancer, macular edema, bradycardia & lymphocytopenia.

Ciccone A, Beretta S, Brusaferri F, et al. **Corticosteroids** for the long-term treatment in multiple sclerosis. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD006264. There is no enough evidence that long-term corticosteroid treatment delays progression of long term disability in patients with MS. Since one study at high risk of bias showed that the administration of pulsed high dose i. v. MP is associated with a significant reduction in the risk of long term disability progression in patients with RR MS, an adequately powered, a quality RCT is needed to investigate this finding.
Clerico M, Faggiano F, Palace J, Rice G, Tintorè M, Durelli L. Recombinant **interferon beta** or glatiramer acetate for delaying conversion of the **first demyelinating event to multiple sclerosis**. Cochrane Database Syst Rev. 2008 Apr 16;(2):CD005278. The efficacy of IFN beta treatment on preventing the conversion from CIS to CDMS was confirmed over two years of follow-up. Since patients had some clinical heterogeneity (length of follow-up, clinical findings of initial attack), it could be useful for the clinical practice to further analyse the efficacy of IFN beta treatment in different patient subgroups.

Health Canada June/08 There have been rare reports of serious liver injury in patients receiving Tysabri, occurring as early as 6 days after first dose. Tysabri product label has been updated for liver injury, hypersensitivity reactions and herpes infections.

Health Canada Feb/12 is informing Canadians of an ongoing safety review of the multiple sclerosis (MS) drug **Gilenya** (the brand name for **fingolimod**). The review was initiated following reports of serious adverse events, including 11 deaths reported internationally. No deaths have been reported in Canada.

Hellwig K, Schimrigk S, Fischer M, et al. Allergic and nonallergic delayed infusion reactions during **natalizumab** therapy. Arch Neurol. 2008 May;65(5):656-8. **Delayed infusion reactions** occurred in 4 of 40 relapse-remitting multiple sclerosis patients treated with natalizumab. Our cases illustrate that some of these infusion reactions may be treated effectively with steroids and reduction of the infusion rate. In cases of antibody-mediated reactions, treatment should be stopped immediately.

Kappos L, et al. Long-term subcutaneous interferon beta-1a therapy in patients with relapsing-remitting MS. (PRISMS) study Neurology. 2006 Sep 26;67(6):944-53. Despite the limitations inherent in any long-term study (for example, potential differences between returning and nonreturning patients), these results indicate that patients with relapsing-remitting multiple sclerosis can experience sustained benefit over many years from early interferon beta-1a subcutaneous therapy three times weekly compared with patients whose treatment is delayed. This effect was more apparent in the patients receiving the higher dose.

Kappos L, et al.; FTY720 D2201 Study Group. Oral fingolimod (FTY720) for relapsing multiple sclerosis. N Engl J Med. 2006 Sep 14;355(11):1124-40.

Kuhle J, Pohl C, Mehling M, et al. Lack of association between antimyelin antibodies and progression to multiple sclerosis. N Engl J Med. 2007 Jan 25;356(4):371-8. Presence of anti-MOG or anti-MBP or both was not significantly associated with conversion to CDMS in our CIS cohort. However, patients with anti-myelin oligodendrocyte glycoprotein (anti-MOG) and anti-myelin basic protein antibodies (anti-MBP) had higher lesion load & more disseminated lesions in cranial MRI as well as higher values for CSF leucocytes and intrathecal IgG production. Our data support a correlation of anti-MOG & anti-MBP to inflammatory signs in MRI & CSF. The prognostic value of these antibodies for CDMS, seems to be less pronounced than previously reported.

Marriott JJ, Miyasaki JM, Gronseth G, O'Connor PW. Evidence Report: The efficacy and safety of **mitoxantrone** (Novantrone) in the treatment of multiple sclerosis: Report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology (AAN) . Neurology. 2010 May 4;74(18):1463-70. http://www.neurology.org/cgi/reprint/74/18/1463

The accumulated Class III and IV evidence suggests an increased incidence of systolic dysfunction and therapy-related acute leukemia (TRAL) with mitoxantrone therapy. Systolic dysfunction occurs in approximately 12% of patients with MS treated with mitoxantrone, congestive heart failure occurs in approximately 0.4%, and leukemia occurs in approximately 0.8%. The number needed to harm is 8 for systolic dysfunction and 123 for TRAL.

NICE: National Institute for Health and Clinical Excellence**. Natalizumab** for the treatment of adults with highly active relapsing-remitting multiple sclerosis. London (UK): National Institute for Health & Clinical Excellence (NICE); 2007 Aug. 21 p. (Technology appraisal guidance; no. 127). Natalizumab is recommended as an option for the treatment only of rapidly evolving severe relapsing–remitting multiple sclerosis (RES). RES is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI. People currently receiving natalizumab, but for whom treatment would not have been recommended according to the above section of this guidance, should have the option to continue therapy until they and their clinicians consider it appropriate to stop.

Pucci E, Giuliani G, Solari A, Simi S, Minozzi S, Di Pietrantonj C, Galea I. **Natalizumab** for relapsing remitting multiple sclerosis. Cochrane Database of Systematic Reviews 2011, Issue 10. Art. No.: CD007621. DOI: 10.1002/14651858.CD007621.pub2. Although one trial did not contribute to efficacy results due to its duration, we found robust evidence in favour of a reduction in relapses and disability at 2 years in RRMS patients treated with NTZ. The drug was well tolerated. There are current significant safety concerns due to reporting of an increasing number of PML cases in patients treated with NTZ. This review was unable to provide an up-to-date systematic assessment of the risk due to the maximum 2 year-duration of the trials included. An independent systematic review of the safety profile of NTZ is warranted. NTZ should be used only by skilled neurologists in MS centres under surveillance programs.

NORdic trial of oral Methylprednisolone as add-on therapy to Interferon beta-1a for treatment of relapsing-remitting Multiple Sclerosis (**NORMIMS** study): a randomised, placebo-controlled trial. Lancet Neurol. 2009 Apr 29. [Epub ahead of print] Oral methylprednisolone given in pulses every 4 weeks as an add-on therapy to subcutaneous interferon beta-1a in patients with relapsing-remitting multiple sclerosis leads to a significant reduction in relapse rate. However, because of the small number of patients and the high dropout rate, these findings need to be corroborated in larger cohorts.

FDA Drug Safety Communication: Ongoing Safety Review of **Stalevo** (entacapone/carbidopa/levodopa) and possible development of **Prostate Cancer** in **STRIDE-PD** trial. Mar/10 http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/ucm206363.htm In that trial, 3.7% of pts taking Stalevo developed prostate cancer over a mean follow-up of 2.7 years, compared with 0.9% of patients taking carbidopa/levodopa (Sinemet) (odds ratio, 4.2). Previous trials of Stalevo and Comtan (entacapone) did not find an association with prostate cancer.
FDA Drug Safety Communication Aug/10 : Patients taking **Stalevo** (carbidopa/levodopa plus entacapone) for Parkinson disease might be at greater risk for **cardiovascular events** than those taking Sinemet (carbidopa/levodopa), according to the FDA. The agency conducted a meta-analysis after the STRIDE-PD trial found a higher rate of myocardial infarction in patients using Stalevo. The meta-analysis of 15 clinical trials found an association between Stalevo and cardiovascular events (relative risk, 2.46), but the results were no longer significant after excluding the STRIDE-PD data.

Stowe R, Ives N, Clarke CE, Deane K; et al. Evaluation of the efficacy and safety of **adjuvant treatment to levodopa therapy** in Parkinson s disease patients with motor complications. Cochrane Database Syst Rev. 2010 Jul 7;7:CD007166. Compared to placebo, adjuvant therapy reduces off-time, levodopa dose, and improves UPDRS scores in PD patients who develop motor complications on levodopa therapy. However, this is at the expense of increased dyskinesia and numerous other side-effects. Indirect comparisons suggest that dopamine agonist therapy may be more effective than COMTI and MAOBI therapy, which have comparable efficacy. However, as indirect comparisons should be interpreted with caution, direct head-to-head randomised trials assessing the impact of these different drug classes on overall patient-rated quality of life are needed.
Storch A, Jost WH, Vieregge P, et al. Randomized, Double-blind, Placebo-Controlled Trial on Symptomatic Effects of **Coenzyme Q10** 100mg tid in Parkinson Disease. Arch Neurol. 2007 May 14; [Epub ahead of print] N=131 3months. Nanoparticular CoQ(10) at a dosage of 300 mg/d is safe and well tolerated and leads to plasma levels similar to 1200 mg/d of standard formulations. Add-on CoQ(10) does not display symptomatic effects in midstage Parkinson disease.

Guidelines AAN:

Cheng EM, Tonn S, Swain-Eng R, et al.; For the American Academy of Neurology Parkinson Disease Measure Development Panel. **Quality improvement** in neurology: AAN Parkinson disease quality measures: Report of the Quality Measurement and Reporting Subcommittee of the American Academy of Neurology. Neurology. 2010 Nov 30;75(22):2021-2027. http://www.neurology.org/content/75/22/2021.full.pdf+html

Miyasaki JM, et al.; Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: evaluation and treatment of **depression, psychosis, and dementia** in Parkinson disease (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):996-1002. http://www.neurology.org/cgi/reprint/66/7/996 Screening tools are available for depression and dementia in patients with PD, but more specific validated tools are needed. There are no widely used, validated tools for psychosis screening in Parkinson disease (PD). Clozapine successfully treats psychosis in PD. Cholinesterase inhibitors are effective treatments for dementia in PD, but improvement is modest and motor side effects may occur.

Pahwa R, et al.; Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: treatment of Parkinson disease with **motor fluctuations and dyskinesia** (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):983-95. http://www.neurology.org/cgi/reprint/66/7/983 1. Entacapone and rasagiline should be offered to reduce off time (Level A). Pergolide, pramipexole, ropinirole, and tolcapone should be considered to reduce off time (Level B). Apomorphine, cabergoline, and selegiline may be considered to reduce off time (Level C). 2. The available evidence does not establish superiority of one medicine over another in reducing off time (Level B). Sustained release carbidopa/levodopa and bromocriptine may be disregarded to reduce off time (Level C). 3. Amantadine may be considered to reduce dyskinesia (Level C). 4. Deep brain stimulation of the STN may be considered to improve motor function and reduce off time, dyskinesia, and medication usage (Level C). There is insufficient evidence to support or refute the efficacy of DBS of the GPi or VIM nucleus of the thalamus in reducing off time, dyskinesia, or medication usage, or to improve motor function. 5. Preoperative response to levodopa predicts better outcome after DBS of the STN (Level B).

Suchowersky O, et al.; Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: **neuroprotective strategies and alternative** therapies for Parkinson disease (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):976-82. http://www.neurology.org/cgi/reprint/66/7/976 1. Levodopa does not appear to accelerate disease progression. 2. No treatment has been shown to be neuroprotective. 3. There is no evidence that vitamin or food additives can improve motor function in PD. 4. Exercise may be helpful in improving motor function. 5. Speech therapy may be helpful in improving speech volume. 6. No manual therapy has been shown to be helpful in the treatment of motor symptoms, although studies in this area are limited. Further studies using a rigorous scientific method are needed to determine efficacy of alternative therapies.

Suchowersky O, et al. Quality Standards Subcommittee of the American Academy of Neurology. Practice Parameter: diagnosis and prognosis of **new onset Parkinson** disease (an evidence-based review): report of the Quality Standards Subcommittee of the American Academy of Neurology. Neurology. 2006 Apr 11;66(7):968-75. http://www.neurology.org/cgi/reprint/66/7/968 1. Early falls, poor response to levodopa, symmetry of motor manifestations, lack of tremor, and early autonomic dysfunction are probably useful in distinguishing other parkinsonian syndromes from Parkinson disease (PD). 2. Levodopa or apomorphine challenge and olfactory testing are probably useful in distinguishing PD from other parkinsonian syndromes. 3. Predictive factors for more rapid motor progression, nursing home placement, and shorter survival time include older age at onset of PD, associated comorbidities, presentation with rigidity and bradykinesia, and decreased dopamine responsiveness. Future research into methods for earlier and more accurate diagnosis of the disease and identification and clarification of predictive factors of rapid disease progression is warranted.

Approach to Migraine: Considerations

- ACUTE: - may consider metoclopramide or domperidone 1st; NSAID and/or triptan also recommended first line;
  - in very severe attacks, SC sumatriptan likely to be most effective & rapid; consider need for rapid onset vs recurrence, GI tolerance of po form, etc.
  - Link to Review Article in AFP Feb 2011: http://www.aafp.org/afp/2011/0201/p271.html
- PROPHYLAXIS: 1st line: beta-blockers (propranolol, metoprolol), TCAs, valproic acid, topiramate.
- MENSTRUAL Related Migraine (MRM): - severity may be increased; duration of headache may be longer and may be harder to treat than regular migraine
  - may consider NSAID or triptan for short-term treatment, several days before and during menstruation [20].

Both BoNTA and DVPX significantly reduced disability associated with migraine; BoNTA had a favorable tolerability profile compared with DVPX.
Naumann M, So Y, Argoff CE, Childers MK, Dykstra DD, Gronseth GS, Jabbari B, Kaufmann HC, Schurch B, Silberstein SD, Simpson DM; Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Assessment: Botulinum neurotoxin in the treatment of autonomic disorders and pain (an evidence-based review): report of the Therapeutics and Technology Assessment Subcommittee of the American Academy of Neurology. Neurology. 2008 May 6;70(19):1707-14. Botulinum neurotoxin (BoNT) should be offered as a treatment option for the treatment of axillary hyperhidrosis and detrusor overactivity (Level A), should be considered for palmar hyperhidrosis, drooling, and detrusor sphincter dyssynergia after spinal cord injury (Level B), and may be considered for gustatory sweating and low back pain (Level C). BoNT is probably ineffective in episodic migraine and chronic tension-type headache (Level B). There is presently no consistent or strong evidence to permit drawing conclusions on the efficacy of BoNT in chronic daily headache (mainly transformed migraine) (Level U). While clinicians' practice may suggest stronger recommendations in some of these indications, evidence-based conclusions are limited by the availability of data.

[18] Linde K, Streng A, Jurgens S, et al. Acupuncture for patients with migraine: a randomized controlled trial. JAMA. 2005 May 4;293(17):2118-25. . (InfoPOEMs: Acupuncture and sham acupuncture are equally more effective than no treatment in patients with migraine headaches. These results defend the adage that doing something is better than doing nothing. (LOE = 1b)). & Coeytaux RR, Kaufman JS, Kaptchuk TJ, et al. A randomized, controlled trial of **acupuncture** for chronic daily headache. Headache. 2005 Oct;45(9):1113-23.
Linde K, Allais G, Brinkhaus B, Manheimer E, Vickers A, White AR. **Acupuncture** for migraine prophylaxis. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD001218. In the previous version of this review, evidence in support of acupuncture for migraine prophylaxis was considered promising but insufficient. Now, with 12 additional trials, there is consistent evidence that acupuncture provides additional benefit to treatment of acute migraine attacks only or to routine care. There is no evidence for an effect of 'true' acupuncture over sham interventions, though this is difficult to interpret, as exact point location could be of limited importance. Available studies suggest that acupuncture is at least as effective as, or possibly more effective than, prophylactic drug treatment, and has fewer adverse effects. Acupuncture should be considered a treatment option for patients willing to undergo this treatment.

49. Kurth T, et al. Migraine and risk of **cardiovascular** disease in women. JAMA. 2006 Jul 19;296(3):283-91. Erratum in: JAMA. 2006 Jul 19;296(3):1 p following 291. In this large, prospective cohort of women, active migraine with aura was associated with increased risk of major CVD, myocardial infarction, ischemic stroke, and death due to ischemic CVD, as well as with coronary revascularization and angina. (InfoPOEMs: Women suffering from active migraines with aura are at an increased risk of ischemic vascular events, including coronary heart disease and stroke. In general, this correlates to 18 additional cardiovascular events for every 10,000 women per year. Women with active migraine without aura are not at an increased risk of ischemic vascular disease. (LOE = 2b-))

55. Detsky ME, et al. Does this patient with headache have a **migraine** or **need neuroimaging**? JAMA. 2006 Sep 13;296(10):1274-83. The best predictors can be summarized by the mnemonic POUNDing (Pulsating, duration of 4-72 hOurs, Unilateral, Nausea, Disabling). The presence of 4 simple historical features can accurately diagnose migraine. Several individual clinical features were found to be associated with a significant intracranial abnormality, and patients with these features should undergo neuroimaging. (InfoPOEMs: Useful clinical criteria from the history and physical for distinguishing migraine from tension-type headache include: nausea, photophobia, phonophobia, and exacerbation by physical activity. Combined findings useful for distinguishing migraine can be summarized by the mnemonic: POUNDing (Pulsatile quality; duration of 4 to 72 hOurs; Unilateral location; Nausea or vomiting; Disabling intensity). Patients with 4 or more of these criteria are most likely to have migraine headaches. Criteria increasing the risk of intracranial pathology include: cluster-type headache; abnormal neurologic examination result; undefined headache; headache with aura; headache aggravated by exertion or valsalva-like maneuver; and headache with vomiting. No clinical features from the history and physical are useful for significantly reducing the likelihood of intracranial pathology. (LOE = 3a))

78. Bigal M, Sheftell F, Tepper S, Tepper D, Ho TW, Rapoport A. A randomized double-blind study comparing **rizatriptan, dexamethasone**, and the combination of both in the acute treatment of **menstrually related migraine**. Headache. 2008 Oct;48(9):1286-93. Rizatriptan is an effective treatment for MRM. RI+DE is significantly more effective than RI alone, although is associated with higher rate of adverse events.The combination should be considered for subjects with high disability, incomplete relief, or recurrence of pain with triptan monotherapy.The use of DE alone in the treatment of MRM is not justified based on our data.
79. Linde K, Allais G, Brinkhaus B, Manheimer E, Vickers A, White AR. **Acupuncture** for migraine prophylaxis. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD001218. In the previous version of this review, evidence in support of acupuncture for migraine prophylaxis was considered promising but insufficient. Now, with 12 additional trials, there is consistent evidence that acupuncture provides additional benefit to treatment of acute migraine attacks only or to routine care. There is no evidence for an effect of 'true' acupuncture over sham interventions, though this is difficult to interpret, as exact point location could be of limited importance. Available studies suggest that acupuncture is at least as effective as, or possibly more effective than, prophylactic drug treatment, and has fewer adverse effects. Acupuncture should be considered a treatment option for patients willing to undergo this treatment.
80. Linder SL, Mathew NT, Cady RK, Finlayson G, Ishkanian G, et al. Efficacy and tolerability of **almotriptan in adolescents**: a randomized, double-blind, placebo-controlled trial. Headache. 2008 Oct;48(9):1326-36. Epub 2008 May 14. Oral almotriptan was efficacious for relieving migraine headache pain in adolescents, with the 12.5-mg dose associated with the most favorable efficacy profile with respect to relieving headache pain and associated symptoms of migraine (photophobia and phonophobia). Almotriptan treatment was well tolerated in this adolescent population.

52. Wiffen P, Collins S, McQuay H, Carroll D, Jadad A, Moore A. Anticonvulsant drugs for acute and chronic pain. Cochrane Database Syst Rev. 2005 Jul 20;(3):CD001133. CONCLUSIONS: Although anticonvulsants are used widely in chronic pain surprisingly few trials show analgesic effectiveness. Only one studied considered cancer pain. There is no evidence that anticonvulsants are effective for acute pain. In chronic pain syndromes other than trigeminal neuralgia, anticonvulsants should be withheld until other interventions have been tried. While gabapentin is increasingly being used for neuropathic pain the evidence would suggest that it is not superior to carbamazepine.
53. Pandya KJ, Morrow GR, Roscoe JA, et al. **Gabapentin** for hot flashes in 420 women with breast cancer: a randomised double-blind placebo-controlled trial. Lancet. 2005 Sep 3-9;366(9488):818-24. Gabapentin is effective in the control of hot flashes at a dose of 900 mg/day, but not at a dose of 300 mg/day. This drug should be considered for treatment of hot flashes in women with breast cancer. (InfoPOEMs: Women with a history of breast cancer may obtain some relief from hot flashes with 900 mg gabapentin daily. The 300 mg daily dose was not effective. (LOE = 1b-))

60. Prasad K, Al-Roomi K, Krishnan P, Sequeira R, Prasad K. Anticonvulsant therapy for **status epilepticus**. **Cochrane** Database Syst Rev. 2005 Oct 19;(4):CD003723. AUTHORS' CONCLUSIONS: **Lorazepam is better than diazepam or phenytoin** alone for cessation of seizures and carries a lower risk of continuation of status epilepticus requiring a different drug or general anaesthesia. Both lorazepam and diazepam are better than placebo for the same outcomes. In the treatment of premonitory seizures, diazepam 30 mg in an intrarectal gel is better than 20 mg for cessation of seizures without a statistically significant increase in adverse effects. Universally accepted definitions of premonitory, early, established and refractory status epilepticus are required.

78. Seizure control & treatment in pregnancy. Observations from the EURAP Epilepsy Pregnancy Registry. Neurology. 2005 Dec 28; CONCLUSIONS: The majority of patients with epilepsy maintain seizure control during pregnancy. The apparently higher risk of seizures among women treated with oxcarbazepine & the more frequent increases in drug load in the oxcarbazepine & lamotrigine cohorts prompts further studies on relationships with pharmacokinetic changes. Risks associated with status epilepticus appear to be lower than previously reported.

86. Meierkord H, et al. EFNS guideline on the management of status epilepticus. Eur J Neurol. 2006 May;13(5):445-50. The preferred treatment pathway for generalised convulsive status epilepticus (GCSE) is intravenous (i.v.) administration of 4 mg of lorazepam or 10 mg of diazepam directly followed by 15-18 mg/kg of phenytoin or equivalent fosphenytoin. If seizures continue for more than 10 min after first injection another 4 mg of lorazepam or 10 mg of diazepam is recommended. Refractory GCSE is treated by anaesthetic doses of midazolam, propofol or barbiturates; the anaesthetics are titrated against an electroencephalogram burst suppression pattern for at least 24 h. The initial therapy of non-convulsive SE depends on the type and the cause. In most cases of absence SE, a small i.v. dose of lorazepam or diazepam will terminate the attack. Complex partial SE is initially treated such as GCSE, however, when refractory further non-anaesthetising substances should be given instead of anaesthetics. In subtle SE i.v. anaesthesia is required.

89. Health Canada Aug/06 **Lamictal** warning with non-syndromic **oral clefts**. Emerging data from the North American Antiepileptic Drug (NAAED) Pregnancy Registry suggest an association between LAMICTAL and an increased risk of non-syndromic oral clefts over the reference population for the registry (ie. Active Malformations Surveillance Program at Brigham and Women's Hospital in Boston, USA)1. Recently published data from the Registry report three cases of isolated, non syndromic cleft palate and two cases of isolated, non syndromic cleft lip without cleft palate in infants from 564 first trimester lamotrigine monotherapy exposures giving a rate of 8.9 per 1,000, as compared to 0.37 per 1000 in the reference population for that registry. The prevalence of oral clefts noted in the NAAED registry is also higher than the background prevalence of non-syndromic oral clefts reported in the literature, including studies from the United States, Australia and Europe. While different studies have differing results due to geographic and case ascertainment variations, the reported range is 0.50 to 2.16/1000 3-17. To assist with the assessment of risk, analysis of data from additional pregnancy registries, with approximately 2200 additional lamotrigine monotherapy first trimester exposures has been conducted, and 4 additional non-syndromic cases of oral cleft have been identified.

127. Marson AG, Al-Kharusi AM, Alwaidh M, et al; **SANAD** Study group. The SANAD study of effectiveness of valproate, lamotrigine, or topiramate for generalised and unclassifiable epilepsy: an unblinded randomised controlled trial. Lancet. 2007 Mar 24;369(9566):1016-26. Valproate is better tolerated than topiramate and more efficacious than lamotrigine, and should remain the drug of first choice for many patients with generalised and unclassified epilepsies. However, because of known potential adverse effects of valproate during pregnancy, the benefits for seizure control in women of childbearing years should be considered.
128. Marson AG, Al-Kharusi AM, Alwaidh M, et al. **SANAD** Study group. The SANAD study of effectiveness of carbamazepine, gabapentin, lamotrigine, oxcarbazepine, or topiramate for treatment of partial epilepsy: an unblended randomised controlled trial. Lancet. 2007 Mar 24;369(9566):1000-15. Lamotrigine is clinically better than carbamazepine, the standard drug treatment, for time to treatment failure outcomes and is therefore a cost-effective alternative for patients diagnosed with partial onset seizures.

144. Hunt S, Russell A, Smithson WH, Parsons L, Robertson I, Waddell R, Irwin B, Morrison PJ, Morrow J, Craig J; UK Epilepsy and Pregnancy Register. **Topiramate** in pregnancy: preliminary experience from the UK Epilepsy and **Pregnancy Register**. Neurology. 2008 Jul 22;71(4):272-6. The number of outcomes of human pregnancies exposed to topiramate is low, but the major congenital malformation rate for topiramate polytherapy raises some concerns. Overall, the rate of oral clefts observed was 11 times the background rate. Although the present data provide new information, they should be interpreted with caution due to the sample size and wide confidence intervals.
FDA Mar/11 notified healthcare professionals and patients of an increased risk of development of cleft lip and/or cleft palate (oral clefts) in infants born to women treated with Topamax (topiramate) during pregnancy. Because of new human data that show an increased risk for oral clefts, topiramate is being placed in Pregnancy Category D.
145. Vestergaard M, Pedersen MG, Ostergaard JR, et al. Death in children with **febrile seizures**: a population-based cohort study. Lancet. 2008 Aug 9;372(9637):457-63. Long-term mortality is not increased in children with febrile seizures, but there seems to be a small excess mortality during the 2 years after complex febrile seizures. Parents should be reassured that death after febrile seizures is very rare, even in high-risk children.

The risk of bacterial meningitis presenting as first simple febrile seizure at ages 6 to 18 months is very low. American Academy of Pediatrics recommendations should be reconsidered.
156. Levi N, Bastuji-Garin S, Mockenhaupt M, Roujeau JC, et al. Medications as risk factors of **stevens-johnson syndrome** and toxic epidermal necrolysis in children: a pooled analysis. Pediatrics. 2009 Feb;123(2):e297-304. Epub 2009 Jan 19. We confirmed 4 previously highly suspected drug risk factors for Stevens-Johnson syndrome/toxic epidermal necrolysis in children: antiinfective sulfonamides, phenobarbital, carbamazepine, and lamotrigine. Among more unexpected risk factors, we suspect that acetaminophen (paracetamol) use increases the risk of Stevens-Johnson syndrome or toxic epidermal necrolysis.

Epilepsia. 2009 May;50(5):1237-46. (Valproate should be avoided during the first trimester of pregnancy. Among the other findings: Women with epilepsy who take antiepileptic drugs have twice the risk for delivering babies with Apgar scores under 7. Valproate is associated with increased risk for congenital malformations. Avoiding valproate, phenobarbital, and phenytoin during pregnancy may reduce the risk for poor cognitive outcomes (all are class D drugs), while carbamazepine (class C) "probably does not produce cognitive impairments." Monotherapy for epilepsy is preferable to polytherapy, if possible, to reduce poor cognitive outcomes. http://www.aan.com/globals/axon/assets/5476.pdf

Primidone and levetiracetam probably transfer into breast milk in clinically important amounts. Valproate, phenobarbital, phenytoin, and carbamazepine probably are not transferred into breast milk in clinically important amounts. Pregnancy probably causes an increase in the clearance and a decrease in the concentrations of lamotrigine, phenytoin, and, to a lesser extent carbamazepine, and possibly decreases the level of levetiracetam and the active oxcarbazepine metabolite, the monohydroxy derivative (MHD). Supplementing WWE with at least 0.4 mg of folic acid before pregnancy may be considered. Monitoring of lamotrigine, carbamazepine, and phenytoin levels during pregnancy should be considered, and monitoring of levetiracetam and oxcarbazepine (as MHD) levels may be considered.

176. Moore RA, Straube S, Wiffen PJ, et al. **Pregabalin** for **acute and chronic pain** in adults. Cochrane Database Syst Rev. 2009 Jul 8;(3):CD007076. Pregabalin has proven efficacy in neuropathic pain conditions and fibromyalgia. A minority of patients will have substantial benefit with pregabalin, and more will have moderate benefit. Many will have no or trivial benefit, or will discontinue because of adverse events. Individualisation of treatment is needed to maximise pain relief and minimise adverse events. There is no evidence to support the use of pregabalin in acute pain scenarios.

Adverse pregnancy and birth outcome in women with epilepsy is mainly confined to AED-exposed pregnancies, although some risks are associated also with untreated epilepsy. The risk for congenital malformations was lower than previously reported. This could be due to a shift in AED selection, folic acid supplement, or possibly reflect the true risks in an unselected epilepsy population.

Preventing Gaps when Switching Contraceptives. Lesnewski '11

Switching from →	Switching to	Comments
Combined OC, progestin only pill	Combined OC, progestin only pill	♦switch **directly** from one pill to another; do not miss a day
Combined OC	Patch or Ring	♦start patch **day before** last pill; start ring **day after** last pill ♦Do not need to complete pill cycle before switch
Patch or Ring	Combined OC	♦start pill day **before** scheduled to remove patch/ring; i.e. no more than 8 days after last patch (effective up to 9 days) or 34 days after ring (effective up to 35days) ♦Do not need to complete full cycle for patch/ring before pill starts
Patch	Ring	♦insert ring & remove patch on **same day**
Ring	Patch	♦Apply patch **2 days before** ring removal
Combined OC, patch or ring	Progestin IUD or injection	♦Continue pill, patch or ring x **7days** (or use barrier)
Copper IUD	Progestin IUD (i.e Mirena)	♦Use barrier **x 7 days**; return to fertility may be immediate
Copper IUD	Progestin injection (i.e. Depo-Provera)	♦Give injection **7 days before** IUD removal; if done on same day, use **barrier x 7days**
Copper IUD	Combined OC, patch, or ring	♦Start new method **7 days before** removal of IUD or use **barrier x 7days**
Progestin IUD (i.e. Mirena) or injection (i.e. Depo-Provera)	Combined OC, patch, or ring	♦Start new method **7 days before** removal of IUD or next injection (i.e. may start new method **up to 15 weeks after** last injection)
Combined OC, patch or ring	Copper IUD	♦Can insert copper IUD up to **five days** after stopping pill, patch or ring
Progestin IUD (i.e. Mirena)	Copper IUD	♦Can insert copper IUD **right after removing** progestin IUD
Progestin injection (i.e. Depo-Provera)	Copper IUD	♦Can insert copper IUD **up to 16weeks after** the last shot

Consider: Abstain from sexual intercourse or use a barrier method (condoms +/- spermicide) if no overlap in methods for a minimum of 7days for most switches (see above table for exact number of days in bold print)

"Patient Friendly" Statistics for Contraceptive Failure Rates: http://www.fda.gov/ForConsumers/ByAudience/ForWomen/ucm118465.htm#hormonal

Out of 100 women who use the following method for 1 year:

- Injection, progestin IUD – 1 may get pregnant
- COC, POP, patch & ring – 5 may get pregnant
- Male condoms – 11 to 16 may get pregnant
- Diaphragm – 15 may get pregnant
- Sponge – 16 to 32 may get pregnant
- Female condoms – 20 may get pregnant
- Spermicide along – 30 may get pregnant

FDA Oct/11 released the final report of an FDA-funded study looking into the risk for venous thromboembolism (VTE) in women taking oral contraceptives containing drospirenone. As previously reported by Medscape Medical News, on September 26 the FDA said preliminary findings from the study indicate that women who use **drospirenone-containing birth control pills have an approximately 1.5-fold increase** in the risk of developing blood clots relative to women using other types of hormonal contraceptives.
FDA Drug Safety Communication Sept/11: Safety review update on the possible increased risk of blood clots with birth control pills containing drospirenone. http://www.fda.gov/Drugs/DrugSafety/ucm273021.htm (Accessed November 29th, 2011).
FDA Apr/12 has completed its review of recent observational (epidemiologic) studies regarding the risk of blood clots in women taking drospirenone-containing birth control pills.Based on this review, FDA has concluded that **drospirenone**-containing birth control pills may be associated with a higher risk for blood clots than other progestin-containing pills. . Report that some epidemiologic studies reported as high as a three-fold increase in the risk of blood clots for drospirenone-containing products when compared to products containing levonorgestrel or some other progestins, whereas other epidemiological studies found no additional risk of blood clots with drospirenone-containing products.

TOP

Lopez LM, Newmann SJ, Grimes DA, Nanda K, Schulz KF. **Immediate start** of hormonal contraceptives for contraception. *Cochrane Database Syst Rev.* 2008;(2):CD006260.

Lopez LM, et al. **Skin patch and vaginal ring versus combined oral contraceptives** for contraception. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD003552. Effectiveness rates were similar for the methods compared. The patch group had better compliance than the COC group. Compared to COC users, patch users had more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge. The patch could lead to more discontinuation while the vaginal ring showed little difference. High losses to follow up can affect the validity of the results.

Lopez LM, Grimes DA, Chen-Mok M, et al. Hormonal contraceptives for **contraception in overweight or obese women**. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008452. Body weight addresses overall body size, while BMI generally reflects the amount of fat. Only one of three studies using BMI found a higher pregnancy risk for overweight women. The efficacy of implants and injectable contraceptives may be unaffected by body mass. The field could use trials of contraceptive methods with groups stratified by BMI. The current evidence on effectiveness by BMI is limited. However, the contraceptive methods examined here are still among the most effective when the recommended regimen is followed.

Lopez LM, Edelman A, Chen-Mok M, Trussell J, Helmerhorst FM. **Progestin-only contraceptives: effects on weight**. Cochrane Database Syst Rev. 2011 Apr 13;4:CD008815. We found little evidence of weight gain when using POCs. Mean gain was less than 2 kg for most studies up to 12 months, and usually similar for the comparison group using another contraceptive.

Loder EW, et al. **Headache** as a side effect of combination estrogen-progestin oral contraceptives: a systematic review. Am J Obstet Gynecol. 2005 Sep;193(3 Pt 1):636-49. (InfoPOEMs: There is not a clearly documented causal relationship between headaches and oral contraceptives (OCs). Headaches that patients attribute to initiation of OCs tend to improve over time. There is no evidence to support change of formulation to manage headache. Manipulation of estrogen withdrawal has not been sufficiently studied. (LOE = 1a-))

Am J Epidemiol. 2007 Oct 15;166(8):894-901. Epub 2007 Jul 26. Results suggest that the beneficial effect of oral contraceptives on ovarian cancer risk attenuates after 20 years since last use. Furthermore, tubal ligation, intrauterine device use, and infertility were associated with ovarian cancer risk.

van Hylckama Vlieg A, Helmerhorst F M, Vandenbroucke J P, et al. The venous **thrombotic risk** of oral contraceptives, effects of oestrogen dose and progestogen type: results of the MEGA case-control study. BMJ 2009;339:b2921, doi: 10.1136/bmj.b2921 (Published 13 August 2009)

Van Vliet HA, Grimes DA, Lopez LM, et al. **Triphasic versus monophasic** oral contraceptives for contraception. Cochrane Database Syst Rev. 2011 Nov 9;11:CD003553. The available evidence is insufficient to determine whether triphasic OCs differ from monophasic OCs in effectiveness, bleeding patterns or discontinuation rates. Therefore, we recommend monophasic pills as a first choice for women starting OC use. Large, high-quality RCTs that compare triphasic and monophasic OCs with identical progestogens are needed to determine whether triphasic pills differ from monophasic OCs.

Westhoff C, et al. Initiation of Oral Contraceptives Using a **Quick Start** Compared With a Conventional Start: A Randomized Controlled Trial. Obstet Gynecol. 2007 Jun;109(6):1270-1276. Protocols that require a woman to wait until the next menses to start hormonal contraceptives are an obstacle to contraceptive initiation. Directly observed, immediate initiation of the pill improves short-term continuation. (InfoPOEMs: The immediate start of oral contraceptives (OCs) in young women improves initiation, but not continuation of use, and does not decrease pregnancy rates. (LOE = 1b))

Extras:

Preventing Gaps when Switching Contraceptives. Lesnewski '11

Switching from →	Switching to	Comments
Combined OC, progestin only pill	Combined OC, progestin only pill	♦switch directly from one pill to another; do not miss a day
Combined OC	Patch or Ring	♦start patch day before last pill; start ring day after last pill ♦Do not need to complete pill cycle before switch
Patch or Ring	Combined OC	♦start pill day before scheduled to remove patch/ring; i.e. no more than 8 days after last patch (effective up to 9 days) or 34 days after ring (effective up to 35days) ♦Do not need to complete full cycle for patch/ring before pill starts
Patch	Ring	♦insert ring & remove patch on same day
Ring	Patch	♦Apply patch 2 days before ring removal
Combined OC, patch or ring	Progestin IUD or injection	♦Continue pill, patch or ring x 7days (or use barrier)
Copper IUD	Progestin IUD (i.e Mirena)	♦Use barrier x 7 days; return to fertility may be immediate
Copper IUD	Progestin injection (i.e. Depo-Provera)	♦Give injection 7 days before IUD removal; if done on same day, use barrier x 7days
Copper IUD	Combined OC, patch, or ring	♦Start new method 7 days before removal of IUD or use barrier x 7days
Progestin IUD (i.e. Mirena) or injection (i.e. Depo-Provera)	Combined OC, patch, or ring	♦Start new method 7 days before removal of IUD or next injection (i.e. may start new method up to 15 weeks after last injection)
Combined OC, patch or ring	Copper IUD	♦Can insert copper IUD up to five days after stopping pill, patch or ring
Progestin IUD (i.e. Mirena)	Copper IUD	♦Can insert copper IUD right after removing progestin IUD
Progestin injection (i.e. Depo-Provera)	Copper IUD	♦Can insert copper IUD up to 16weeks after the last shot

Consider: Abstain from sexual intercourse or use a barrier method (condoms +/- spermicide) if no overlap in methods for a minimum of 7days for most switches (see above table for exact number of days in bold print)

"Patient Friendly" Statistics for Contraceptive Failure Rates: http://www.fda.gov/ForConsumers/ByAudience/ForWomen/ucm118465.htm#hormonal

Out of 100 women who use the following method for 1 year:

- Injection, progestin IUD – 1 may get pregnant
- COC, POP, patch & ring – 5 may get pregnant
- Male condoms – 11 to 16 may get pregnant
- Diaphragm – 15 may get pregnant
- Sponge – 16 to 32 may get pregnant
- Female condoms – 20 may get pregnant
- Spermicide along – 30 may get pregnant

♦Study with **IMPLANON** USA found that lactogenisis not affected by early postpartum (on day 1-3) insertion.

There was a more than **two-fold increase** in the risk of venous thromboembolism associated with the transdermal contraceptive system.
Collaborative Group on Epidemiological Studies of **Ovarian Cancer**, Beral V, Doll R, Hermon C, Peto R, Reeves G. Ovarian cancer and oral contraceptives: collaborative reanalysis of data from 45 epidemiological studies including 23,257 women with ovarian cancer and 87,303 controls. Lancet. 2008 Jan 26;371(9609):303-14. Use of oral contraceptives confers long-term protection against ovarian cancer. These findings suggest that oral contraceptives have already prevented some 200,000 ovarian cancers and 100,000 deaths from the disease, and that over the next few decades the number of cancers prevented will rise to at least 30,000 per year.
Creinin MD, Meyn LA, Borgatta L, et al. Multicenter comparison of the contraceptive ring and patch: a randomized controlled trial. Obstet Gynecol. 2008 Feb;111(2 Pt 1):267-77. The majority of women who are using oral contraceptives (OCs) and try the **vaginal ring** continue with the ring rather than go back to OCs. Most women who try patches go back **to OCs**. It is uncertain whether the nonmasked nature of the trial, which was funded by the manufacturer of the vaginal ring, introduced bias into the study. (LOE = 1b-)

FDA BCDSP VTE & PE Evra Risk Jan/08 http://www.fda.gov/bbs/topics/NEWS/2008/NEW01781.html

FDA Apr/12 has completed its review of recent observational (epidemiologic) studies regarding the risk of blood clots in women taking drospirenone-containing birth control pills.Based on this review, FDA has concluded that **drospirenone**-containing birth control pills may be associated with a higher risk for blood clots than other progestin-containing pills. . Report that some epidemiologic studies reported as high as a three-fold increase in the risk of blood clots for drospirenone-containing products when compared to products containing levonorgestrel or some other progestins, whereas other epidemiological studies found no additional risk of blood clots with drospirenone-containing products.

Hidalgo MM, Hidalgo-Regina C, Bahamondes MV, et al. Serum levonorgestrel levels & endometrial thickness during extended use of the **levonorgestrel-releasing intrauterine** system. Contraception. 2009 Jul;80(1):84-9. Epub 2009 Feb 27. During extended use of the LNG-IUS, serum LNG levels were nearly half those found in the first 2 months of use (Wilcoxon signed rank test); serum E(2) levels were normal. Despite the very thin endometrium, menstrual bleeding was reinstated in many cases. At the end of its 5-year life span, there is a window for changing the LNG-IUS, and physicians and users should not be concerned about delaying replacement of the device for a short time beyond the approved life span; however, maintaining the same device long after its approved life span cannot be recommended.

Hofmeyr GJ, Singata M, Lawrie TA. **Copper containing intra-uterine devices versus depot progestogens** for contraception. Cochrane Database Syst Rev. 2010 Jun 16;6:CD007043. In the populations studied, the IUD was more effective than hormonal contraception with respect to pregnancy prevention.

Lopez LM, et al. Skin patch and vaginal ring versus combined oral contraceptives for contraception. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD003552. Effectiveness rates were similar for the methods compared. The patch group had better compliance than the COC group. Compared to COC users, patch users had more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge. The patch could lead to more discontinuation while the vaginal ring showed little difference. High losses to follow up can affect the validity of the results.

Lopez LM, Grimes DA, Gallo MF, Schulz KF. Skin patch and **vaginal ring versus combined oral contraceptives** for contraception. Cochrane Database Syst Rev. 2010 Mar 17;3:CD003552. Effectiveness was similar for the methods compared. The patch could lead to more discontinuation while the vaginal ring showed little difference. The patch group had better compliance than the COC group but more side effects. Ring users generally had fewer adverse events than COC users but more vaginal irritation and discharge.

Lopez LM, Newmann SJ, Grimes DA, Nanda K, Schulz KF. **Immediate start** of hormonal contraceptives for contraception. *Cochrane Database Syst Rev.* 2008;(2):CD006260.

Lopez LM, Grimes DA, Chen-Mok M, et al. Hormonal contraceptives for **contraception in overweight or obese women**. Cochrane Database Syst Rev. 2010 Jul 7;7:CD008452. Body weight addresses overall body size, while BMI generally reflects the amount of fat. Only one of three studies using BMI found a higher pregnancy risk for overweight women. The efficacy of implants and injectable contraceptives may be unaffected by body mass. The field could use trials of contraceptive methods with groups stratified by BMI. The current evidence on effectiveness by BMI is limited. However, the contraceptive methods examined here are still among the most effective when the recommended regimen is followed.

Lopez LM, Edelman A, Chen-Mok M, et al. **Progestin-only contraceptives: effects on weight**. Cochrane Database Syst Rev. 2011 Apr 13;4:CD008815. We found little evidence of weight gain when using POCs. Mean gain was less than 2 kg for most studies up to 12 months, and usually similar for the comparison group using another contraceptive. Appropriate counseling about typical weight gain may help reduce discontinuation of contraceptives due to perceptions of weight gain.

Loprinzi CL, et al. Phase III comparison of depomedroxyprogesterone acetate to venlafaxine for managing hot flashes: North Central Cancer Treatment Group Trial N99C7. J Clin Oncol. 2006 Mar 20;24(9):1409-14. Epub 2006 Feb 27.

Van Vliet HA, Grimes DA, Lopez LM, et al. **Triphasic versus monophasic** oral contraceptives for contraception. Cochrane Database Syst Rev. 2011 Nov 9;11:CD003553.
The available evidence is insufficient to determine whether triphasic OCs differ from monophasic OCs in effectiveness, bleeding patterns or discontinuation rates. Therefore, we recommend monophasic pills as a first choice for women starting OC use. Large, high-quality RCTs that compare triphasic and monophasic OCs with identical progestogens are needed to determine whether triphasic pills differ from monophasic OCs.

Neurology. 2009 Jan 13;72(2):135-42. Conjugated equine estrogens with or without MPA are associated with greater brain atrophy among women aged 65 years and older; however, the adverse effects are most evident in women experiencing cognitive deficits before initiating hormone therapy.
Coker LH, Hogan PE, Bryan NR, et al. Postmenopausal hormone therapy and subclinical cerebrovascular disease: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):125-34. Conjugated equine estrogen-based hormone therapy was not associated with a significant increase in ischemic brain lesion volume relative to placebo. This finding was consistent within each trial and in pooled analyses across trials.

[34] Shumaker SA, Legault C, et al.; **WHIMS**. Estrogen plus progestin & the incidence of dementia & mild cognitive impairment in postmenopausal women: Women's Health Initiative Memory Study: a randomized controlled trial. JAMA. 2003 May 28;289(20):2651-62. Estrogen plus progestin therapy increased the risk for probable dementia in postmenopausal women aged 65 years or older. In addition, estrogen plus progestin therapy did not prevent mild cognitive impairment in these women. (Shumaker SA, et al.; Women's Health Initiative Memory Study. Conjugated equine estrogens and incidence of probable dementia and mild cognitive impairment in postmenopausal women: Women's Health Initiative Memory Study. JAMA. 2004 Jun 23;291(24):2947-58. Estrogen therapy alone did not reduce dementia or MCI incidence and increased the risk for both end points combined.) (Maki PM, Gast MJ, Vieweg AJ, Burriss SW, Yaffe K. Hormone therapy in menopausal women with cognitive complaints: a randomized, double-blind trial. Neurology. 2007 Sep 25;69(13):1322-30. n=180. Cognitive Complaints in Early Menopause Trial (COGENT-stopped beause of WHI). There were no differences between groups on any cognitive or QoL measures, except for an increase in sexual interest and thoughts with HT. With the power to detect an effect size of >or=0.45, this study suggests potential modest negative effects on verbal memory that are consistent with previous hormone therapy trials in older women.) Petitti DB, Crooks VC, Chiu V, Buckwalter JG, Chui HC. Incidence of dementia in long-term hormone users. Am J Epidemiol. 2008 Mar 15;167(6):692-700. Epub 2008 Jan 23. After adjustment for age, education, and medical history, hazard ratios for incident dementia were 1.34 (95% confidence interval: 0.95, 1.89) in estrogen/progestin users and 1.23 (95% confidence interval: 0.94, 1.59) in estrogen users. These findings do not provide support for an effect of estrogen or estrogen/progestin use in preventing dementia.

TOP

increase the risk of breast cancer in postmenopausal women with prior hysterectomy. Women receiving estrogen are more likely to require further testing as a result of questionably abnormal mammogram results, potentially leading to heightened anxiety and a reduced quality of life. The decision to use estrogen in postmenopausal women after hysterectomy should be individualized on the basis of overall potential risks and benefits. Women most likely to benefit from estrogen therapy include those with disabling hot flashes and an increased risk of osteoporotic fractures. Treatment should be limited whenever possible to the first 5 years (or less) after menopause. (LOE = 1b)))

(Rossouw JE, Prentice RL, Manson JE, et al. Postmenopausal hormone therapy and risk of cardiovascular disease by age and years since menopause. JAMA 2007; 297:1465-1477. Women who initiated hormone therapy closer to menopause tended to have reduced CHD risk compared with the increase in CHD risk among women more distant from menopause, but this trend test did not meet our criterion for statistical significance. A similar nonsignificant trend was observed for total mortality but the risk of stroke was elevated regardless of years since menopause.)

Ravdin PM, Cronin KA, Howlader N, et al. The **decrease in breast-cancer incidence** in 2003 in the United States. N Engl J Med 2007:356; 1670-1674. The decrease in breast-cancer incidence seems to be temporally related to the first report of the Women's Health Initiative and the ensuing drop in the use of hormone-replacement therapy among postmenopausal women in the United States.

Beral V, Million Women Study Collaborators. Ovarian cancer and hormone replacement therapy in the Million Women Study. Lancet 2007; DOI:10.1016/S0140-6736(07)60534-0.

Beral V; Million Women Study Collaborators; Bull D, Green J, Reeves G. Ovarian cancer and hormone replacement therapy in the **Million Women Study**. Lancet. 2007 May 19;369(9574):1703-10. Women who use HRT are at an increased risk of both incident and fatal ovarian cancer. Since 1991, use of HRT has resulted in some 1300 additional ovarian cancers and 1000 additional deaths from the malignancy in the UK.

Manson JE, Allison MA, Rossouw JE, Carr JJ, Langer RD, Hsia J, Kuller LH, Cochrane BB, Hunt JR, Ludlam SE, Pettinger MB, Gass M, Margolis KL, Nathan L, Ockene JK, Prentice RL, Robbins J, Stefanick ML; WHI and WHI-CACS Investigators. Estrogen therapy and **coronary-artery calcification**. N Engl J Med. 2007 Jun 21;356(25):2591-602. n=1064 Among women 50 to 59 years old at enrollment, the calcified-plaque burden in the coronary arteries after trial completion was lower in women assigned to estrogen only than in those assigned to placebo.

Vickers MR, MacLennan AH, Lawton B, et al. Main morbidities recorded in the Women's International Study of Long Duration Oestrogen After Menopause (**WISDOM**): a randomized controlled trial of hormone replacement therapy in postmenopausal women. BMJ 2007; DOI:10.1136/bmj.39266.425069 Hormone replacement therapy increases cardiovascular and thromboembolic risk when started many years after the menopause. The results are consistent with the findings of the women's health initiative study and secondary prevention studies. Research is needed to assess the long term risks and benefits of starting hormone replacement therapy near the menopause, when the effect may be different.

Kerlikowske K, Miglioretti DL, Buist DS, Walker R, Carney PA. **Declines in Invasive Breast Cancer** and Use of Postmenopausal Hormone Therapy in a Screening Mammography Population. J Natl Cancer Inst. 2007 Aug 14; [Epub ahead of print] Our finding of a statistically significant decline in the rate of ER-positive invasive breast cancer in a screening mammography population after the start of a concomitant substantial decline in postmenopausal hormone therapy use suggests that a decline in screening mammography rates is unlikely to account for the recent decline in US breast cancer incidence.

Li CI, Malone KE, Porter PL, et al. Relationship between Menopausal Hormone Therapy and Risk of Ductal, Lobular, and Ductal-Lobular Breast Carcinomas. Cancer Epidemiol Biomarkers Prev. 2008 Jan;17(1):43-50. Current CHT users for **>/=3 years have a substantially increased risk of lobular carcinomas**. Although lobular carcinomas are less common than ductal carcinomas (approximately 16% versus 70% of all invasive breast cancers in the United States), this duration is shorter than the 5 years of use widely cited to be needed to confer an increased risk of breast cancer overall.

Chlebowski RT, Anderson G, Pettinger M, et al. for the Women's Health Initiative Investigators. Estrogen Plus Progestin and **Breast Cancer Detection by Means of Mammography and Breast Biopsy**. Arch Intern Med. 2008 Feb 25;168(4):370-377. Use of conjugated equine estrogens plus medroxyprogesterone acetate for approximately 5 years resulted in more than 1 in 10 and 1 in 25 women having otherwise avoidable mammogram abnormalities and breast biopsies, respectively, and compromised the diagnostic performance of both. This adverse effect on breast cancer detection should be incorporated into risk-benefit discussions with women considering even short-term combined hormone therapy.

Heiss G, Wallace R, Anderson GL, et al. WHI Investigators. Health risks and benefits **3 years after stopping** randomized treatment with estrogen and progestin. JAMA. 2008 Mar 5;299(9):1036-45. The increased cardiovascular risks in the women assigned to CEE plus MPA during the intervention period were not observed after the intervention. A greater risk of fatal & nonfatal malignancies occurred after intervention in the CEE plus MPA group & the global risk index was 12% higher in women randomly assigned to receive CEE plus MPA compared with placebo.

Rohan TE, Negassa A, Chlebowski RT, et al.Conjugated Equine Estrogen and Risk of **Benign Proliferative Breast Disease**: WHI - A Randomized Controlled Trial. J Natl Cancer Inst. 2008 Apr 8; [Epub ahead of print] Use of 0.625 mg/d of CEE was associated with a statistically significant increased risk of benign proliferative breast disease.

Bray PF, Larson JC, Lacroix AZ, et al. Women's Health Initiative Investigators. Usefulness of baseline lipids and C-reactive protein in women receiving menopausal hormone therapy as predictors of treatment-related coronary events. Am J Cardiol. 2008 Jun 1;101(11):1599-1605. Epub 2008 Apr 2. In conclusion, postmenopausal women with **undesirable lipid levels** had excess coronary heart disease risk when using CEE with or without MPA. However, women with favorable lipid levels, especially LDL/HDL cholesterol ratio <2.5, did not have increased risk of coronary heart disease with CEE with or without MPA irrespective of hs-CRP.

Resnick SM, Espeland MA, Jaramillo SA, Hirsch C, Stefanick ML, Murray AM Ockene J, Davatzikos C. Postmenopausal hormone therapy and regional **brain volumes**: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):135-42. Conjugated equine estrogens with or without MPA are associated with greater brain atrophy among women aged 65 years and older; however, the adverse effects are most evident in women experiencing cognitive deficits before initiating hormone therapy.

Coker LH, Hogan PE, Bryan NR, et al. Postmenopausal hormone therapy and **subclinical cerebrovascular disease**: the WHIMS-MRI Study. Neurology. 2009 Jan 13;72(2):125-34. Conjugated equine estrogen-based hormone therapy was not associated with a significant increase in ischemic brain lesion volume relative to placebo. This finding was consistent within each trial and in pooled analyses across trials.

Chlebowski RT, Kuller LH, Prentice RL, Stefanick ML, et al. WHI Investigators. **Breast cancer** after use of estrogen plus progestin in postmenopausal women. N Engl J Med. 2009 Feb 5;360(6):573-87. The increased risk of breast cancer associated with the use of estrogen plus progestin declined markedly soon after discontinuation of combined hormone therapy and was unrelated to changes in frequency of mammography.

Shetty KD, Vogt WB, Bhattacharya J. Hormone replacement therapy and cardiovascular health in the United States. Med Care. 2009 May;47(5):600-6. Decreased HRT use was not associated with reduced acute stroke rate but was associated with a decreased **acute myocardial infarction** rate among women. Our results suggest that observational data can provide correct inferences on clinical outcomes in the overall population if a suitable natural experiment is identified.

Prentice RL, Manson JE, Langer RD, et al. Benefits and risks of postmenopausal hormone therapy when it is initiated **soon after menopause**. (WHI) Am J Epidemiol. 2009 Jul 1;170(1):12-23. Epub 2009 May 25. These analyses provide little support for the hypothesis of favorable effects among women who initiate postmenopausal estrogen use soon after menopause, either for coronary heart disease or for health benefits versus risk indices considered.

Cummings SR, Ettinger B, Delmas PD, et al. **LIFT** Trial Investigators. The effects of **tibolone** in older postmenopausal women. N Engl J Med. 2008 Aug 14;359(7):697-708. Tibolone reduced the risk of fracture and breast cancer and possibly colon cancer but increased the risk of stroke in older women with osteoporosis. For every 1000 women treated for 1 year with tibolone, there will be approximately 9 fewer vertebral fractures, 7 fewer nonvertebral fractures, 2 fewer breast cancers, 1 fewer colon cancer, 2 more strokes, and 1 additional endometrial cancer. Although the authors recommend that tibolone not be used in women older than 70 years or in those who have risk factors for stroke, it is hard to see a compelling advantage of this drug for any group of women since bisphosphonates provide a safer way to prevent fracture. (LOE = 1b)

Haimov-Kochman R, Hochner-Celnikier D. Hot flashes revisited: pharmacological and herbal options for hot flashes management. What does the evidence tell us? Acta Obstet Gynecol Scand. 2005 Oct;84(10):972-9. CONCLUSIONS: A critical review of the literature shows that progesterone may have an independent effect on relieving hot flashes. New nonhormonal agents such as selective serotonin-uptake-inhibitor anti-depressants and a new anti-convulsant gabapentin yielded promising results on small well-conducted studies. Isoflavone's effect on hot flashes is variable and inconsistent, and only modest and delayed improvement of symptoms could be expected by BC and vitamin E. There are insufficient data on the other herbal alternative therapies at this time. Well-designed large studies are needed to further explore new modalities of treatment.

Lethaby A, Hogervorst E, Richards M, Yesufu A, Yaffe K. Hormone replacement therapy for **cognitive function** in postmenopausal women. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD003122. There is good evidence that both ERT and HRT do not prevent cognitive decline in older postmenopausal women when given as short term or longer term (up to five years) therapy. It is not known whether either specific types of ERT or HRT have specific effects in subgroups of women, although there was evidence that combined hormone therapy in similarly aged women was associated with a decrement in a number of verbal memory tests and a small improvement in a test of figural memory.

Nelson HD, et al. **Nonhormonal therapies for menopausal hot flashes: systematic review** and meta-analysis. JAMA. 2006 May 3;295(17):2057-71. The SSRIs or SNRIs, clonidine, and gabapentin trials provide evidence for efficacy; however, effects are less than for estrogen, few trials have been published and most have methodological deficiencies, generalizability is limited, and adverse effects and cost may restrict use for many women. These therapies may be most useful for highly symptomatic women who cannot take estrogen but are not optimal choices for most women. (InfoPOEMs: Evidence supports the nonhormonal treatment of menopausal hot flashes with paroxetine (Paxil), clonidine (Catapres), gabapentin (Neurontin), and soy isoflavone extract. The overall effect size of all nonhormonal treatments is less than that of estrogen. Treatment should be individualized according to symptom severity and risk profiles. (LOE = 1a-)) (Reddy SY, et al. Gabapentin, Estrogen, and Placebo for Treating Hot Flushes: A Randomized Controlled Trial. Obstet Gynecol. 2006 Jul;108(1):41-48. Despite the small scale of this study, (12 week n=60) gabapentin appears to be as effective as estrogen in the treatment of postmenopausal hot flushes. (InfoPOEMs: In this small study, high-dose gabapentin (Neurontin) was as effective as the usual dose of conjugated equine estrogens (Premarin) for the treatment of menopausal vasomotor symptoms. Larger studies are needed to confirm this result. (LOE = 1b))) (Loprinzi CL, et al. North American Menopause Society. The role of **local vaginal estrogen for treatment of vaginal atrophy** in postmenopausal women: **2007 position statement** of The North American Menopause Society. Menopause. 2007 May-Jun;14(3):370-1. The choice of therapy should be guided by clinical experience and patient preference. Progestogen is generally not indicated when low-dose estrogen is administered locally for vaginal atrophy. Data are insufficient to recommend annual endometrial surveillance in asymptomatic women using vaginal ET. Vaginal ET should be continued for women as long as distressful symptoms remain. For women treated for non-hormone-dependent cancer, management of vaginal atrophy is similar to that for women without a cancer history. For women with a history of hormone-dependent cancer, management recommendations are dependent upon each woman's preference in consultation with her oncologist.

North American Menopause Society. **NAMS**: Estrogen and progestogen use in postmenopausal women: 2010 position statement of The North American Menopause Society. Menopause. **2010** Feb 12. Osmers R, Friede M, et al. Efficacy and safety of isopropanolic **black cohosh** extract for climacteric symptoms. Obstet Gynecol 2005; 105:1074-83. (InfoPOEMs: This study reports that isopropanolic black cohosh extract (Remifemin) at a dose of 20 mg twice daily is statistically more effective than placebo for the treatment of menopausal vasomotor symptoms. These results will probably be used to promote its use. However, the authors did not supply sufficient data to determine the extent of benefit or the number needed to treat. This evidence is insufficient to determine whether black cohosh has a clinically relevant effect in treating menopausal symptoms. (LOE = 1b-)) CONCLUSION: This isopropanolic extract of black cohosh root stock is effective in relieving climacteric symptoms, especially in early climacteric women.
