[8] Schulz KF, Chalmers I, Hayes RJ, Altman DG. Empirical evidence of bias. Dimensions of methodological quality associated with estimates of treatment effects in controlled trials. JAMA. 1995 Feb 1;273(5):408-12. {Compared with trials in which authors reported adequately concealed treatment allocation, trials in which concealment was either inadequate or unclear (did not report or incompletely reported a concealment approach) yielded larger estimates of treatment effects (P < .001). Odds ratios were exaggerated by 41% for inadequately concealed trials and by 30% for unclearly concealed trials (adjusted for other aspects of quality). Trials in which participants had been excluded after randomization did not yield larger estimates of effects, but that lack of association may be due to incomplete reporting. Trials that were not double-blind also yielded larger estimates of effects (P = .01), with odds ratios being exaggerated by 17%.}

[9] Moher D, Pham B, Jones A, Cook DJ, Jadad AR, Moher M, Tugwell P, Klassen TP. Does quality of reports of randomised trials affect estimates of intervention efficacy reported in meta-analyses? Lancet. 1998 Aug 22;352(9128):609-13. {FINDINGS: The quality of trials was low. Masked assessments provided significantly higher scores than unmasked assessments (mean 2.74 [SD 1.10] vs 2.55 [1.20]). Low-quality trials (score < or = 2), compared with high-quality trials (score > 2), were associated with an increased estimate of benefit of 34% (ratio of odds ratios [ROR] 0.66 [95% CI 0.52-0.83]). Trials that used inadequate allocation concealment, compared with those that used adequate methods, were also associated with an increased estimate of benefit (37%; ROR=0.63 [0.45-0.88]). The average treatment benefit was 39% (odds ratio [OR] 0.61 [0.57-0.65]) for all trials, 52% (OR 0.48 [0.43-0.54]) for low-quality trials, and 29% (OR 0.71 [0.65-0.77]) for high-quality trials. Use of all the trial scores as quality weights reduced the effects to 35% (OR 0.65 [0.59-0.71]) and resulted in the least statistical heterogeneity. INTERPRETATION: Studies of low methodological quality in which the estimate of quality is incorporated into the meta-analyses can alter the interpretation of the benefit of intervention, whether a scale or component approach is used in the assessment of trial quality.}

Ebrahim S, Taylor F, Ward K, Beswick A, Burke M, Davey Smith G. Multiple risk factor interventions for primary prevention of coronary heart disease. Cochrane Database of Systematic Reviews 2011, Issue 1. Art. No.: CD001561. DOI: 10.1002/14651858.CD001561.pub3. Interventions using counselling and education aimed at behaviour change do not reduce total or CHD mortality or clinical events in general populations but may be effective in reducing mortality in high-risk hypertensive and diabetic populations. Risk factor declines were modest but owing to marked unexplained heterogeneity between trials, the pooled estimates are of dubious validity. Evidence suggests that health promotion interventions have limited use in general populations.

A Science Advisory From the American Heart Association Nutrition Subcommittee of the Council on Nutrition, Physical Activity, and Metabolism; Council on Cardiovascular Nursing; and Council on Epidemiology and Prevention. Circulation. 2009 Jan 26. [Epub ahead of print] In summary, the AHA supports an omega-6 PUFA intake of at least 5% to 10% of energy in the context of other AHA lifestyle and dietary recommendations. To reduce omega-6 PUFA intakes from their current levels would be more likely to increase than to decrease risk for CHD.

Incorporating ethnicity, deprivation, and other clinical conditions into the QRISK2 algorithm for risk of cardiovascular disease improves the accuracy of identification of those at high risk in a nationally representative population. At the 20% threshold, QRISK2 is likely to be a more efficient and equitable tool for treatment decisions for the primary prevention of cardiovascular disease. As the validation was performed in a similar population to the population from which the algorithm was derived, it potentially has a "home advantage." Further validation in other populations is therefore advised. www.qrisk.org

Hooper L, Summerbell CD, Thompson R, et al. Reduced or modified dietary fat for preventing cardiovascular disease. Cochrane Database of Systematic Reviews 2011, Issue 7. Art. No.: CD002137. DOI: 10.1002/14651858.CD002137.pub2. The findings are suggestive of a small but potentially important reduction in cardiovascular risk on modification of dietary fat, but not reduction of total fat, in longer trials. Lifestyle advice to all those at risk of cardiovascular disease and to lower risk population groups, should continue to include permanent reduction of dietary saturated fat and partial replacement by unsaturates. The ideal type of unsaturated fat is unclear.

Ingelsson E, Schaefer EJ, Contois JH, et al. Clinical utility of different lipid measures for prediction of coronary heart disease in men and women. JAMA 2007; 298:776-785. In this large, population-based cohort, the overall performance of apo B:apo A-I ratio for prediction of CHD was comparable with that of traditional lipid ratios but did not offer incremental utility over total cholesterol:HDL-C. These data do not support measurement of apo B or apo A-I in clinical practice when total cholesterol and HDL-C measurements are available. Measurement of the apolipoprotein B:apolipoprotein A-I ratio is comparable with, but does not offer any incremental utility to, standard lipid level ratios in predicting coronary heart disease (CHD). Routine measurement of apolipoprotein levels in clinical practice should be discouraged. (LOE = 1b)

DOI: 10.1002/14651858.CD009217. Despite collating more event data than previous systematic reviews of randomised controlled trials (665 deaths in some 6,250 participants), there is still insufficient power to exclude clinically important effects of reduced dietary salt on mortality or cardiovascular morbidity in normotensive or hypertensive populations. Further RCT evidence is needed to confirm whether restriction of sodium is harmful for people with heart failure. Our estimates of benefits from dietary salt restriction are consistent with the predicted small effects on clinical events attributable to the small blood pressure reduction achieved.

Some food groups in the Mediterranean diet are more important than others in promoting health and longer life, according to this prospective cohort study from the Greek segment of the European Prospective Investigation into Cancer and nutrition (EPIC). The researchers investigated the importance of individual components of the diet and found that eating more vegetables, fruits, nuts, pulses, and olive oil, and drinking moderate amounts of alcohol is linked to people living longer, whereas following a Mediterranean diet high in seafood and cereals and low in dairy products was not an indicator of longevity.

Wannamethee SG, Welsh P, Lowe GD, et al. N-terminal pro-brain natriuretic peptide is a more useful predictor of cardiovascular disease risk than C-reactive protein in older men with and without preexisting cardiovascular disease. J Am Coll Cardiol 2011; 58:56-64.
Wang TJ et al. Multiple biomarkers for the prediction of first major cardiovascular events and death. N Engl J Med 2006 Dec 21; 355:2631-9. Ware JH. (The limitations of risk factors as prognostic tools. N Engl J Med 2006 Dec 21; 355:2615-7.) After adjustment for traditional cardiovascular risk factors, five biomarkers -- BNP, CRP, albumin/creatinine ratio, homocysteine, and renin -- were associated with higher risk of death from any cause, and two – BNP and albumin/creatinine ratio -- with risk of first major cardiovascular events. However, statistically, these biomarkers added only moderately to the predictive ability of conventional risk factors.
Wang NY, Young JH, et al. Blood pressure change and risk of hypertension associated with parental hypertension: the johns hopkins precursors study. Arch Intern Med. 2008 Mar 24;168(6):643-8. Hypertension in both mothers and fathers has a strong independent association with elevated BP levels and incident hypertension over the course of adult life.
Weinstein AR, Sesso HD, Lee IM, Rexrode KM, et al. The joint effects of physical activity and body mass index on coronary heart disease risk in women. Arch Intern Med. 2008 Apr 28;168(8):884-90. The risk of CHD associated with elevated body mass index is considerably reduced by increased physical activity levels. However, the risk is not completely eliminated, reinforcing the importance of being lean and physically active.

JAMA. 2009 Apr 15;301(15):1547-55. Screening for coronary artery disease (CAD) in adults with type 2 diabetes and no indication of existing CAD does not improve outcomes more than standard care. This should come as no surprise -- screening for asymptomatic CAD with electron beam tomography (JAMA 2003; 289:2215-23.) and carotid intima-thickness (Stroke 2001;32:1532-8) also did not improve outcomes. Knowing with additional certainty that a patient is "at risk" for CAD does not result in different medication use nor improved compliance. (LOE = 1b-)

In a small cohort study, the use of ARB therapy in patients with Marfan's syndrome significantly slowed the rate of progressive aortic-root dilation.

Brown MJ, McInnes GT, Papst CC, et al. **Aliskiren** and the calcium channel blocker **amlodipine combination** as an initial treatment strategy for hypertension control (**ACCELERATE**): a randomised, parallel-group trial. Lancet. 2011 Jan 12.

Burgess E, Muirhead N, de Cotret PR, Chiu A, Pichette V, Tobe S; the **SMART** (Supra Maximal Atacand Renal Trial) Investigators. Supramaximal Dose of Candesartan in Proteinuric Renal Disease. J Am Soc Nephrol. 2009 Feb 11. [Epub ahead of print] The authors randomly assigned 269 patients who had persistent proteinuria (>/=1 g/d) despite 7 wk of treatment with the highest approved dosage of candesartan (16 mg/d) to 16, 64, or 128 mg/d candesartan for 30 wk. In conclusion, proteinuria that persists despite treatment with the maximum recommended dosage of candesartan can be reduced by increasing the dosage of candesartan further, but serum potassium levels should be monitored during treatment.

Caton AR, Bell EM, Druschel CM, Werler MM, Lin AE, Browne ML, et al. **Antihypertensive medication use during pregnancy** and the risk of cardiovascular malformations. Hypertension 2009;54:63-70.

Casas JP, et al. Effect of inhibitors of the **renin-angiotensin system** and other antihypertensive drugs on **renal outcomes**: systematic review and meta-analysis. Lancet. 2005 Dec 10;366(9502):2026-2033. INTERPRETATION: The benefits of ACE inhibitors or ARBs on renal outcomes in placebo-controlled trials probably result from a blood-pressure-lowering effect. In patients with diabetes, additional renoprotective actions of these substances beyond lowering blood pressure remain unproven, and there is uncertainty about the greater renoprotection seen in non-diabetic renal disease.

Chang CH, Lin JW, Wu LC, Lai MS. Angiotensin receptor blockade and risk of **cancer** in type 2 diabetes mellitus: A nationwide case-control study. J Clin Oncol 2011; DOI 10.1200/JCO.2011.35.1908. The results did not show an effect of ARBs as a class on increasing cancer incidence in patients with diabetes. However, there was a negative association of losartan but a positive one of candesartan and telmisartan with the overall occurrence of cancer.

Evangelista A, Tornos P, Sambola A, et al.. Long-term vasodilator therapy in patients with severe aortic regurgitation. N Engl J Med. 2005 Sep 29;353(13):1342-9. (InfoPOEMs: This small study does not find that vasodilators such as nifedipine (Procardia) or enalapril (Vasotec) delay the need for aortic valve replacement (AVR) in patients with asymptomatic but severe aortic regurgitation. The study was quite small, and although it is possible that a small but clinically important benefit was not detected, this seems unlikely since the trends actually run against active treatment. (LOE = 1b-))

FDA June/10 June 14, 2010 (Washington, DC) — The FDA is conducting a safety review of the angiotensin receptor blocker **olmesartan** (Benicar, Daiichi Sankyo) after determining that diabetic patients taking the drug in two completed phase 3 trials may have had an excess risk of **cardiovascular death**, the regulatory body has announced [1].The safety announcement says that the FDA's review is "ongoing, and the agency has not concluded that Benicar increases the risk of death. FDA currently believes that the benefits of Benicar in patients with high blood pressure continue to outweigh its potential risks." The agency also notes that "other controlled clinical trials evaluating Benicar and other ARBs have not suggested an increased risk of cardiovascular-related death."The primary end points of the two trials were dominated by measures of renal function.In the Randomized Olmesartan and Diabetes Microalbuminuria Prevention (ROADMAP) study, conducted in Europe, 4447 patients with diabetes and at least one additional cardiovascular risk factor, but no evidence of renal dysfunction, were randomized to receive either olmesartan at 40 mg/day (n=2232) or placebo (n=2215). The trial, sponsored by Sankyo Pharma, ended in July 2009 [2]. In the Olmesartan Reducing Incidence of End Stage Renal Disease in Diabetic Nephropathy Trial (ORIENT), conduced in Japan and Hong Kong, 566 patients with diabetes and renal dysfunction were randomized to receive olmesartan at 10 mg/day to 40 mg/day (n=282) or placebo (n=284).

FDA June/11 Food and Drug Administration drug safety: **No increase in risk of cancer** with certain blood pressure drugs—**angiotensin receptor blockers (ARBs).** June 2, 2011. http://www.fda.gov/Drugs/DrugSafety/ucm257516.htm

FDA Apr/12 notified healthcare professionals of possible risks when using blood pressure medicines containing aliskiren with other drugs called angiotensin converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) in patients with diabetes or kidney (renal) impairment. (Altitude study)

Heran BS, et al. Blood pressure lowering efficacy of angiotensin receptor blockers for primary hypertension. Cochrane Database Syst Rev. 2008 Oct 8;(4):CD003822. The evidence from this review suggests that there are no clinically meaningful BP lowering differences between available ARBs. The BP lowering effect of ARBs is modest and similar to ACE inhibitors as a class; the magnitude of average trough BP lowering for ARBs at maximum recommended doses and above is -8/-5 mmHg. Furthermore, 60 to 70% of this trough BP lowering effect occurs with recommended starting doses. The review did not provide a good estimate of the incidence of harms associated with ARBs because of the short duration of the trials and the lack of reporting of adverse effects in many of the trials.
Heran BS, Musini VM, Bassett K, et al. Angiotensin receptor blockers for heart failure. Cochrane Database Syst Rev. 2012 Apr 18;4:CD003040. In patients with symptomatic HF and systolic dysfunction or with preserved ejection fraction, ARBs compared to placebo or ACEIs do not reduce total mortality or morbidity. ARBs are better tolerated than ACEIs but do not appear to be as safe and well tolerated as placebo in terms of withdrawals due to adverse effects. Adding an ARB in combination with an ACEI does not reduce total mortality or total hospital admission but increases withdrawals due to adverse effects compared with ACEI alone.
Hippisley-Cox J., Coupland C. Effect of combinations of drugs on all cause mortality in patients with ischaemic heart disease: nested case-control analysis. BMJ 2005;330:1059-1063 (7 May), doi:10.1136/bmj.330.7499.1059. Conclusions: Combo of statins, aspirins, & beta-blockers improve survival in high risk pts with cardiovascular dx, although the addition of an angiotensin converting enzyme inhibitor conferred no additional benefit despite the analysis being adjusted for congestive cardiac failure.

Patel A; ADVANCE Collaborative Group, MacMahon S, Chalmers J, Neal B, et al. Effects of a fixed combination of perindopril and indapamide on macrovascular and microvascular outcomes in patients with type 2 diabetes mellitus (the **ADVANCE** trial): a randomised controlled trial. Lancet. 2007 Sep 8;370(9590):829-40. Routine administration of a fixed combination of perindopril and indapamide to patients with type 2 diabetes was well tolerated and reduced the risks of major vascular events, including death. Although the confidence limits were wide, the results suggest that over 5 years, one death due to any cause would be averted among every 79 patients assigned active therapy. (InfoPOEMs: Perindopril (Aceon) plus indapamide (Lozol) is better than placebo in decreasing clinically relevant events in patients with type 2 diabetes who are at high risk of cardiovascular complications. Whether the combination is better than other medications -- like aspirin -- isn't addressed by this study. (LOE = 1b))

Rouleau JL, Warnica WJ, Baillot R, et al.; IMAGINE (Ischemia Management with Accupril post-bypass Graft via Inhibition of the converting Enzyme) Investigators. Effects of angiotensin-converting enzyme inhibition in low-risk patients early after coronary artery bypass surgery. Circulation. 2008 Jan 1;117(1):24-31. Epub 2007 Dec 10. In patients at low risk of cardiovascular events after CABG, routine early initiation of angiotensin-converting enzyme inhibitor therapy does not appear to improve clinical outcome up to 3 years after CABG; however, it increases the incidence of adverse events, particularly early after CABG. Thus, early after CABG, initiation of angiotensin-converting enzyme inhibitor therapy should be individualized and continually reassessed over time according to risk.

Solomon SD, Appelbaum E, Manning WJ, et al.; for the Aliskiren in Left Ventricular Hypertrophy (**ALLAY**) Trial Investigators. Effect of the Direct Renin Inhibitor Aliskiren, the Angiotensin Receptor Blocker Losartan, or Both on Left Ventricular Mass in Patients With Hypertension and Left Ventricular Hypertrophy. Circulation. 2009 Jan 19. [Epub ahead of print] Aliskiren was as effective as losartan in promoting LV mass regression. Reduction in LV mass with the combination of aliskiren plus losartan was not significantly different from that with losartan monotherapy, independent of blood pressure lowering. These findings suggest that aliskiren was as effective as an angiotensin receptor blocker in attenuating this measure of myocardial end-organ damage in hypertensive patients with LV hypertrophy.

Early intravenous then oral metoprolol in 45,852 patients with acute myocardial infarction: randomised placebo-controlled trial. Lancet. 2005 Nov 5;366(9497):1622-32. Second Chinese Cardiac Study COMMIT/CCS-2. Metoprolol 5mg IV over 2-3mins x 3 if HR & BP ok, then 15mins later 50mg po q6h Day 0-1, then 200mg controlled release od vs placebo x ~15days. ↓Reinfarction 2 vs 2.5%, ↓Ventricular fibrilation 2.5 vs 3 %, BUT ↑Cardiogenic shock 5 vs 3.9% (risk more with heart failure, systolic BP <120 & in the first 24hrs). INTERPRETATION: The use of early beta-blocker therapy in acute MI reduces the risks of reinfarction & ventricular fibrillation, but increases the risk of cardiogenic shock, esp. during the first day or so after admission. Consequently, it might generally be prudent to consider starting **beta-blocker therapy in hospital only when the haemodynamic condition after MI has stabilised**.

[29] Singh BN, Singh SN, Reda DJ, et al.; Sotalol Amiodarone Atrial Fibrillation Efficacy Trial (SAFE-T) Investigators. Amiodarone versus sotalol for atrial fibrillation. N Engl J Med. 2005 May 5;352(18):1861-72. Conclusion: Amiodarone and sotalol are equally efficacious in converting atrial fibrillation to sinus rhythm. Amiodarone is superior for maintaining sinus rhythm, but both drugs have similar efficacy in patients with ischemic heart disease. Sustained sinus rhythm is associated with an improved quality of life and improved exercise performance. (InfoPOEMs: Amiodarone was more effective than sotalol at maintaining normal sinus rhythm in patients with chronic atrial fibrillation. However, there was a worrisome trend toward increased mortality in the active treatment groups, and other studies have not found a benefit of rhythm therapy over rate control with anticoagulation. (LOE = 1b))

[30] Groszmann RJ. Beta-blockers to Prevent **Gastroesophageal Varices** in Patients with Cirrhosis. N Engl J Med 2005;353:2254-61. (Timolol is ineffective in preventing varices in unselected patients with cirrhosis & portal hypertension & are associated with an increased number of adverse events.) (InfoPOEMs: Beta-blockers do not prevent the development of varices in patients with cirrhosis and they increase the likelihood of serious adverse events. They are still appropriate for patients with established varices to prevent gastrointestinal hemorrhage. (LOE = 1b))

Dunkelgrun M et al. Bisoprolol (Starting dose 2.5 mg daily, titrated to a perioperative heart rate of 50 to 70 beats per minute) and fluvastatin (fixed dose of 80 mg) for the reduction of perioperative cardiac mortality and myocardial infarction in intermediate-risk patients undergoing noncardiovascular surgery (before surgery, median: 34 days): A randomized controlled trial (**DECREASE-IV**). Ann Surg 2009 Jun; 249:921. (n=1066)
Patients randomized to bisoprolol (N = 533) had a lower incidence of perioperative cardiac death and nonfatal MI than those randomized to bisoprolol-control (2.1% vs. 6.0% events; hazard ratios: 0.34; 95% confidence intervals: 0.17-0.67; P = 0.002). Patients randomized to fluvastatin experienced a lower incidence of the end point than those randomized to fluvastatin-control therapy (3.2% vs. 4.9% events; hazard ratios: 0.65; 95% confidence intervals: 0.35-1.10), but statistical significance was not reached (P = 0.17). Bisoprolol was associated with a significant reduction of 30-day cardiac death and nonfatal MI, while fluvastatin showed a trend for improved outcome.

Bangalore S, Wetterslev J, Pranesh S, Sawhney S, Gluud C, Messerli FH. **Perioperative** beta blockers in patients having non-cardiac surgery: a meta-analysis. Lancet. 2008 Dec 6;372(9654):1962-76. Epub 2008 Nov 13.
Noncardiac surgical patients given perioperative beta-blockers had the same rate of death from all causes, cardiovascular deaths, and congestive heart failure as patients given placebo. The rate of nonfatal myocardial infarctions was lower (number needed to treat [NNT] = 63) at the expense of a higher rate of nonfatal strokes (number needed to treat to harm [NNTH] = 275). In other words, for every 4 heart attacks averted, we would cause 1 stroke. (LOE = 1a-)

Bangalore S, Parkar S, Grossman E, Messerli FH. A meta-analysis of 94,492 patients with hypertension treated with beta blockers to determine the risk of **new-onset diabetes** mellitus. Am J Cardiol. 2007 Oct 15;100(8):1254-62. Epub 2007 Aug 10. In conclusion, beta blockers are associated with an increased risk for new-onset DM, with no benefit for the end point of death or myocardial infarction and with a 15% increased risk for stroke compared with other agents. This risk was greater in patients with higher baseline body mass indexes and higher baseline fasting glucose levels and in studies in which beta blockers were less efficacious antihypertensive agents compared with other treatments.

Bangalore S, et al. Relation of Beta-Blocker–Induced Heart Rate Lowering and Cardioprotection in Hypertension. J Am Coll Cardiol. 2008 October;52:1482–9. In contrast to patients with myocardial infarction and heart failure, beta-blocker–associated reduction in heart rate increased the risk of cardiovascular events and death for hypertensive patients.

Early intravenous then oral metoprolol in 45,852 patients with acute myocardial infarction: randomised placebo-controlled trial. Lancet. 2005 Nov 5;366(9497):1622-32. Second Chinese Cardiac Study COMMIT/CCS-2. Metoprolol 5mg IV over 2-3mins x 3 if HR & BP ok, then 15mins later 50mg po q6h Day 0-1, then 200mg controlled release od vs placebo x ~16days. ↓Reinfarction 2 vs 2.5%, ↓Ventricular fibrilation 2.5 vs 3 %, BUT ↑Cardiogenic shock 5 vs 3.9%. INTERPRETATION: The use of early beta-blocker therapy in acute MI reduces the risks of reinfarction & ventricular fibrillation, but increases the risk of cardiogenic shock, esp. during the first day or so after admission. Consequently, it might generally be prudent to consider starting **beta-blocker therapy in hospital only when the haemodynamic condition after MI has stabilised**.(InfoPOEMs: The early use of metoprolol in patients with acute myocardial infarction who are also receiving thrombolytics and aspirin provides no short-term benefit compared with placebo. Since the early use, however, increases the risk of cardiogenic shock, it may be wise to delay starting metoprolol until the patient is hemodynamically stable. (LOE = 1b))

Chen JM, Heran BS, Perez MI, Wright JM. Blood pressure lowering efficacy of **beta-blockers** as second-line therapy for primary hypertension. **Cochrane** Database Syst Rev. **2010** Jan 20;(1):CD007185. Addition of a beta-blocker to diuretics or calcium-channel blockers reduces BP by 6/4mmHg at 1 times the starting dose and by 8/6 mmHg at 2 times the starting dose. When the blood pressure lowering effect of beta-blockers from this review was compared to that of thiazide diuretics from our previous review (Chen 2009), second-line beta-blockers reduce systolic BP to the same extent as second-line thiazide diuretics, but reduce diastolic BP to a greater degree. The different effect on diastolic BP means that beta-blockers have little or no effect on pulse pressure whereas thiazides cause a significant dose-related decrease in pulse pressure. This difference in the pattern of BP lowering with beta-blockers as compared to thiazides might be the explanation for the fact that beta-blockers appear to be less effective at reducing adverse cardiovascular outcomes than thiazide diuretics, particularly in older individuals.

Cleland JG, et al. COMET Investigators. A comparison of the effects of carvedilol and metoprolol on well-being, morbidity, and mortality (the "patient journey") in patients with heart failure: a report from the Carvedilol Or Metoprolol European Trial (**COMET**). J Am Coll Cardiol. 2006 Apr 18;47(8):1603-11. Epub 2006 Mar 29. (InfoPOEMs: Carvedilol (Coreg) treatment of patients with New York Heart Association (NYHA) functional class II-IV heart failure decreases mortality over 4 years more than metoprolol (number needed to treat = 18). Hospitalization rates, length of stay, and patient reports of symptoms are not different between the 2 drugs. (LOE = 1b))

Connolly SJ, et al. Optimal Pharmacological Therapy in Cardioverter Defibrillator Patients (OPTIC) Investigators. Comparison of beta-blockers, amiodarone plus beta-blockers, or sotalol for prevention of shocks from implantable cardioverter defibrillators: the OPTIC Study: a randomized trial. JAMA. 2006 Jan 11;295(2):165-71. Despite use of advanced ICD technology and treatment with a beta-blocker, shocks occur commonly in the first year after ICD implant. Amiodarone plus beta-blocker is effective for preventing these shocks and is more effective than sotalol but has an increased risk of drug-related adverse effects.

Go AS, Yang J, Gurwitz JH, Hsu J, Lane K, Platt R. Comparative effectiveness of different beta-adrenergic antagonists on mortality among adults with **heart failure** in clinical practice. Arch Intern Med. 2008 Dec 8;168(22):2415-21. Compared with atenolol, the adjusted risks of death were slightly higher with shorter-acting metoprolol tartrate but did not significantly differ for carvedilol in adults with heart failure. Our results should be interpreted cautiously and they suggest the need for randomized trials within real-world settings comparing a broader spectrum of beta-blockers for heart failure.

Halonen J, et al. **Intravenous** administration of **metoprolol** is more effective than oral administration in the prevention of **atrial fibrillation** after cardiac surgery. Circulation. 2006 Jul 4;114(1 Suppl):I1-4. The dosage was 1 to 3 mg/h in the intravenous group and from 25 mg twice per day to 50 mg 3 times per day in the oral group. The incidence of postoperative AF was significantly lower in the intravenous group than in the oral group (16.8% versus 28.1%, P=0.036). No serious adverse effects were associated with intravenous metoprolol therapy. CONCLUSIONS: Our study suggests that intravenous metoprolol is well-tolerated and more effective than oral metoprolol in the prevention of AF after cardiac surgery.

NEJM 2005; 353:349-361. *Conclusions:* Perioperative beta-blocker therapy is associated with a reduced risk of in-hospital death among high-risk, but not low-risk, patients undergoing major noncardiac surgery. Patient safety may be enhanced by increasing the use of beta-blockers in high-risk patients (InfoPOEMs: Patients undergoing major surgery who are at high risk of complications -- those with heart disease, cerebrovascular disease, diabetes, or renal insufficiency -- benefit from perioperative beta-blockade. Low-risk patients (except perhaps those with hypertension and those undergoing high-risk surgery) do not. However, given the possible harms of suddenly discontinuing beta-blockers, those who are already taking them should continue doing so, even if they are at low-risk. (LOE = 2b))

(**AF-CHF**) N Engl J Med. 2008 Jun 19;358(25):2667-77. In patients with atrial fibrillation and congestive heart failure, a routine strategy of rhythm control does not reduce the rate of death from cardiovascular causes, as compared with a rate-control strategy.
Rutten Frans H.; Zuithoff Nicolaas P. A.; et al; {beta}-Blockers May Reduce Mortality and Risk of Exacerbations in Patients With **Chronic Obstructive Pulmonary Disease**. Arch Intern Med. 2010;170(10):880-887.
Salpeter S, Ormiston T, Salpeter E, Salpeter S Md. Cardioselective beta-blockers for chronic obstructive pulmonary disease. Cochrane Database Syst Rev. 2005 Oct 19;4:CD003566. AUTHORS' CONCLUSIONS: Cardioselective beta-blockers, given to patients with COPD in the identified studies did not produce adverse respiratory effects. Given their demonstrated benefit in conditions such as heart failure, coronary artery disease and hypertension, cardioselective beta-blockers should not be routinely withheld from patients with COPD.
Salpeter S, Ormiston T, Salpeter E. Cardioselective beta-blockers for reversible airway disease. Cochrane Database Syst Rev. 2002;(1):CD002992. CONCLUSIONS: Cardioselective beta1-blockers, given to patients with mild-moderate reversible airway disease, do not produce clinically significant adverse respiratory effects in the short term. It is not possible to comment on their effects in patient with more severe or less reversible disease, or on their effect on the frequency or severity of acute exacerbations. Given their demonstrated benefit in conditions such as heart failure, coronary artery disease and hypertension, cardioselective beta1-blockers should not be withheld from patients with mild-moderate reversible airway disease.

Wiysonge C, et al. **Beta-blockers for hypertension**. Cochrane Database Syst Rev. 2007 Jan 24;(1):CD002003. The available evidence does not support the use of beta-blockers as first-line drugs in the treatment of hypertension. This conclusion is based on the relatively weak effect of beta-blockers to reduce stroke and the absence of an effect on coronary heart disease when compared to placebo or no treatment. More importantly, it is based on the trend towards worse outcomes in comparison with calcium-channel blockers, renin-angiotensin system inhibitors, and thiazide diuretics. Most of the evidence for these conclusions comes from trials where atenolol was the beta-blocker used (75% of beta-blocker participants in this review). However, it is not known at present whether beta-blockers have differential effects on younger and elderly patients or whether there are differences between the diffe

beta-blockers.
World Gastroenterology Organisation (WGO). **Esophageal varices**. Munich (Germany): WGO; 2008 Jun. 17 p. http://www.worldgastroenterology.org/assets/downloads/en/pdf/guidelines/18_treatment_e_varices_en.pdf
Wright JM, Musini VM. First-line drugs for hypertension. Cochrane Database Syst Rev. 2009 Jul 8;(3):CD001841. First-line low-dose thiazides reduce all morbidity and mortality outcomes. First-line ACE inhibitors and calcium channel blockers may be similarly effective but the evidence is less robust. First-line high-dose thiazides and first-line beta-blockers are inferior to first-line low-dose thiazides.
Wyse DG, Waldo AL, DiMarco JP, et al. Atrial Fibrillation Follow-up Investigation of Rhythm Management (**AFFIRM**) Investigators. A comparison of rate control and rhythm control in patients with atrial fibrillation. N Engl J Med. 2002 Dec 5;347(23):1825-33. Management of atrial fibrillation with the rhythm-control strategy offers no survival advantage over the rate-control strategy, and there are potential advantages, such as a lower risk of adverse drug effects, with the rate-control strategy. Anticoagulation should be continued in this group of high-risk patients.

[15] Black HR, Elliott WJ, et al. Principal results of the Controlled Onset Verapamil Investigation of Cardiovascular End Points (**CONVINCE**) trial. JAMA. 2003 Apr 23-30;289(16):2073-82. The CONVINCE trial did not demonstrate equivalence of a COER verapamil-based antihypertensive regimen compared with a regimen beginning with a diuretic or beta-blocker. When considered in the context of other trials of calcium antagonists, these data indicate that the effectiveness of calcium-channel therapy in reducing cardiovascular disease is similar but not better than diuretic or beta-blocker treatment.

Hollingsworth JM, et al. Medical therapy to **facilitate urinary stone passage**: a meta-analysis. Lancet. 2006 Sep 30;368(9542):1171-9. Patients given calcium-channel blockers or alpha blockers had a 65% (absolute risk reduction=0.31 95% CI 0.25-0.38) greater likelihood of stone passage than those not given such treatment (pooled risk ratio 1.65; 95% CI 1.45-1.88). The pooled risk ratio for alpha blockers was 1.54 (1.29-1.85) and for calcium-channel blockers with steroids was 1.90 (1.51-2.40). (InfoPOEMs: The limited amount of available data suggest that alpha blockers and calcium channel blockers appear to speed the passage of kidney stones. Furthermore, it appears that combining these medications with steroids provides additional benefit. (LOE = 1a-))

Our results suggest that "medical expulsive therapy," using either alpha-antagonists or calcium channel blockers, augments the stone expulsion rate compared to standard therapy for moderately sized distal ureteral stones. This meta-analysis of low-quality studies shows that ureteral stone passage can be enhanced by treating patients with an alpha-blocker such as tamsulosin (Flomax) or the calcium channel blocker nifedipine (Procardia). Better studies may refute these findings, but for now either approach is an option. (LOE = 1a-)

Double-blind, placebo-controlled study on the effect of the aldosterone receptor antagonist spironolactone in patients who have persistednt proteinuria and are on long-term angiotension-converting enzyme inhibitor therapy, with or without an angiotensin II receptor blocker. Clin J Am Soc Nephrol. 2006 Jan 3;1:256-62.
38. Davis BR, et al.; Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial Collaborative Research Group. Role of diuretics in the prevention of heart failure: the Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial. Circulation. 2006 May 9;113(18):2201-10. Epub 2006 May 1. HF risk decreased with chlorthalidone versus amlodipine or lisinopril use during year 1. Subsequently, risk for those individuals taking chlorthalidone versus amlodipine remained decreased but less so, whereas it was equivalent to those given lisinopril. Prior medication use, follow-up blood pressures, and concomitant medications are unlikely to explain most of the HF differences. Diuretics are superior to calcium channel blockers and, at least in the short term, angiotensin-converting enzyme inhibitors in preventing HF in hypertensive individuals.

47. Eshaghian S, Horwich TB, Fonarow GC. Relation of loop diuretic dose to mortality in advanced heart failure. Am J Cardiol. 2006 Jun 15;97(12):1759-64. Epub 2006 Apr 27.
48. Barzilay JI, Davis BR, Cutler JA, et al. Fasting Glucose Levels and Incident Diabetes Mellitus in Older NondiabeticAdults Randomized to Receive 3 Different Classes of Antihypertensive Treatment: A Report From the Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial (ALLHAT). Arch Intern Med. 2006 Nov 13;166(20):2191-201. Fasting glucose levels increase in older adults with hypertension regardless of treatment type. For those taking chlorthalidone vs other medications, the risk of developing FG levels higher than 125 mg/dL (6.9 mmol/L) is modestly greater, but there is no conclusive or consistent evidence that this diuretic-associated increase in DM risk increases the risk of clinical events.
49. Hollingsworth JM, et al. Medical therapy to **facilitate urinary stone passage**: a meta-analysis. Lancet. 2006 Sep 30;368(9542):1171-9. Patients given calcium-channel blockers or alpha blockers had a 65% (absolute risk reduction=0.31 95% CI 0.25-0.38) greater likelihood of stone passage than those not given such treatment (pooled risk ratio 1.65; 95% CI 1.45-1.88). The pooled risk ratio for alpha blockers was 1.54 (1.29-1.85) and for calcium-channel blockers with steroids was 1.90 (1.51-2.40). (InfoPOEMs: The limited amount of available data suggest that alpha blockers and calcium channel blockers appear to speed the passage of kidney stones. Furthermore, it appears that combining these medications with steroids provides additional benefit. (LOE = 1a-))

51. Black HR, Davis B, Barzilay J, Nwachuku C, et al. Metabolic and Clinical Outcomes in Non-Diabetic Individuals with the Metabolic Syndrome Assigned to Chlorthalidone, Amlodipine, or Lisinopril as Initial Treatment for Hypertension: A Report from the **ALLHAT** Study. Diabetes Care. 2007 Nov 13; [Epub ahead of print] Despite a less favorable metabolic profile, thiazide-like diuretic initial therapy for hypertension offers similar, and in some instances possibly superior, CV disease outcomes in older hypertensive adults with MetS, as compared to treatment with CCBs and ACEI.
52. Wright JT, Harris-Haywood S, Pressel S, et al. Clinical outcomes by race in hypertensive patients with and without the **metabolic syndrome**. ALLHAT. Arch Intern Med 2008; 168:207-217. The ALLHAT findings fail to support the preference for calcium channel blockers, alpha-blockers, or angiotensin-converting enzyme inhibitors compared with thiazide-type diuretics in patients with the MetS, despite their more favorable metabolic profiles.
53. Bomback AS, et al. Change in proteinuria after adding **aldosterone blockers** to ACE inhibitors or angiotensin receptor blockers in CKD: a systematic review. Am J Kidney Dis. 2008 Feb;51(2):199-211. Although data suggest that adding MRBs to ACE-inhibitor and/or ARB therapy yields significant decreases in proteinuria without adverse effects of hyperkalemia and impaired renal function, routine use of MRBs as additive therapy in patients with chronic kidney disease cannot be recommended yet.
54. Lim LS, Fink HA, Kuskowski MA, Taylor BC, Schousboe JT, Ensrud KE; for the Osteoporotic Fractures in Men (MrOS) Study Group. Loop Diuretic Use and Increased Rates of Hip Bone Loss in Older Men: The Osteoporotic Fractures in Men Study. Arch Intern Med. 2008 Apr 14;168(7):735-740. We conclude that loop diuretic use in older men is associated with increased rates of hip **bone loss**. These results suggest that the potential for bone loss should be considered when loop diuretics are prescribed to older patients in clinical practice.
55. Arroll B, Kenealy T, Elley CR. Should we prescribe diuretics for patients with **prediabetes** and hypertension? BMJ. 2008 Aug 21;337:a679. doi: 10.1136/bmj.a679.
56. Davis BR, Kostis JB, Simpson LM, et al. for the ALLHAT Collaborative Research Group. **Heart Failure** With Preserved and Reduced Left Ventricular Ejection Fraction in the Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial. Circulation. 2008 Nov 10. [Epub ahead of print] In **ALLHAT**, with adjudicated outcomes, **chlorthalidone** significantly reduced the occurrence of new-onset hospitalized HFPEF and HFREF compared with amlodipine and doxazosin. Chlorthalidone also reduced the incidence of new-onset HFPEF compared with lisinopril. Among high-risk hypertensive men and women, HFPEF has a better prognosis than HFREF.
57. FDA Nov/08 Balanced Health Products, Inc. announced a recall of **STARCAPS** due to the presence of an undeclared drug ingredient, Bumetanide. Bumetanide is a diuretic indicated for the treatment of edema associated with congestive heart failure, hepatic and renal disease including nephrotic syndrome.
58. Jamerson K, Weber MA, Bakris GL, et al. Benazepril plus Amlodipine or Hydrochlorothiazide for Hypertension in High-Risk Patients. (**ACCOMPLISH**)N Engl J Med. 2008 Dec 4;359(23):2417-2428.
The benazepril-amlodipine combination was superior to the benazepril-hydrochlorothiazide combination in reducing cardiovascular events in patients with hypertension who were at high risk for such events.
59. Escribano J, Balaguer A, Pagone F, Feliu A, Roqué I Figuls M. Pharmacological interventions for preventing complications in idiopathic hypercalciuria. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD004754. There is some evidence that in patients with idiopathic hypercalciuria and recurrent stones, the addition of thiazides to a normal or modified diet for short to long periods (five months to three years) reduced the number of stone recurrences and decreased the stone formation rate. Thiazides and neutral potassium phosphate decreased calciuria in symptomatic patients with idiopathic hypercalciuria. There were no studies investigating the effect of pharmacological treatment on other clinical complications or asymptomatic idiopathic **hypercalciuria**.
60. Carbone LD, Johnson KC, Bush AJ, Robbins J, Larson JC, Thomas A, LaCroix AZ. **Loop diuretic use and fracture** in postmenopausal women: findings from the Women's Health Initiative. Arch Intern Med. 2009 Jan 26;169(2):132-40. After adjustment for confounding variables, no significant association was found between ever use of loop diuretics and changes in BMD, falls, and fractures. Loop diuretics were used by women in poor health who were already at risk for fractures. However, prolonged use of loop diuretics was associated with higher fracture risk in postmenopausal women.
61. Al-Balas M, Bozzo P, Einarson A. Use of diuretics **during pregnancy**. Can Fam Physician. 2009 Jan;55(1):44-5. Many studies--including a meta-analysis of almost 7000 neonates exposed to diuretics during pregnancy—did not find an increased risk of adverse effects, such as birth defects, fetal growth restriction, thrombocytopenia, or diabetes, among neonates exposed to diuretics in utero.

65. Krum H, Skiba M, Gilbert RE. Comparative metabolic effects of **hydrochlorothiazide and indapamide** in hypertensive diabetic patients receiving ACE inhibitor therapy. Diabet Med. 2003 Sep;20(9):708-12
Hydrochlorothiazide 12.5 mg/day, when added to background ACE inhibitor therapy with fosinopril in hypertensive diabetic patients, resulted in a metabolic profile that was similar, if not superior on certain

TOP

comparison with indapamide 2.5 mg/day.
66. Spence JD, Huff M, Barnett PA. Effects of **indapamide versus hydrochlorothiazide** on plasma lipids and lipoproteins in hypertensive patients: a direct comparison. Can J Clin Pharmacol. 2000 Spring;7(1):32-7. Triglyceride levels increased significantly more with indapamide than with HCTZ (P=0.02). The two drugs had similar effects on blood pressure and serum potassium; neither drug affected plasma glucose. Claims that indapamide is superior to HCTZ appear unwarranted; in view of the substantial cost difference, this finding, if confirmed in larger studies, has important policy implications.
67. Shafi T, Appel LJ, Miller ER 3rd, Klag MJ, Parekh RS. Changes in serum potassium mediate thiazide-induced **diabetes**. Hypertension. 2008 Dec;52(6):1022-9. Epub 2008 Nov 3. Erratum in: Hypertension. 2009 Feb;53(2):e19. After year 1, chlorthalidone use was not associated with increased diabetes risk. In conclusion, thiazide-induced diabetes occurs early after initiating treatment and appears to be mediated by changes in serum potassium. Potassium supplementation might prevent thiazide-induced diabetes. This hypothesis can and should be tested in a randomized trial.
68. Grimm RH Jr, Grandits GA, Prineas RJ, et al. Long-term effects on **sexual** function of five antihypertensive drugs and nutritional hygienic treatment in hypertensive men and women. Treatment of Mild Hypertension Study (TOMHS) Hypertension. 1997 Jan;29(1 Pt 1):8-14. In conclusion, long-term incidence of erection problems in treated hypertensive men is relatively low but is higher with chlorthalidone treatment. Effects of erection dysfunction with chlorthalidone appear relatively early and are often tolerable, and new occurrences after 2 years are unlikely. The rate of reported sexual problems in hypertensive women is low and does not appear to differ by type of drug. Similar incidence rates of erection dysfunction in placebo and most active drug groups caution against routine attribution of erection problems to antihypertensive medication.

Boden WE, O'rourke RA, Teo KK, Hartigan PM, et al. Optimal Medical Therapy with or without PCI for Stable Coronary Disease. **COURAGE** Trial Research Group. N Engl J Med. 2007 Mar 26; [Epub ahead of print] As an initial management strategy in patients with stable coronary artery disease, PCI did not reduce the risk of death, myocardial infarction, or other major cardiovascular events when added to optimal medical therapy. PCI does not lower the rates of myocardial infarction or death in patients with stable coronary artery disease who receive optimal medical treatment, a large trial concluded. The study, released early online by NEJM, randomized nearly 2300 patients either to PCI with optimal medical therapy (intensive pharmacologic treatment plus lifestyle intervention) or to optimal medical therapy alone. After a median follow-up of almost 5 years, 19% in the PCI group died or had MIs, compared with 18.5% who received medical therapy alone. PCI patients were more likely to be free of angina after 1 and 3 years, but there was no significant difference after 5 years. One-third of patients in the medical therapy group ultimately required revascularization, while 21% in the PCI group needed additional revascularization. An editorialist concludes: "Patients whose condition is clinically unstable, who have left main coronary artery disease, or in whom medical therapy has failed to control symptoms remain candidates for revascularization, but PCI should not play a major role as part of a secondary prevention strategy."
Weintraub WS, Spertus JA, Kolm P, Maron DJ, Zhang Z, Jurkovitz C, Zhang W,et al.; COURAGE Trial Research Group, Mancini GB. Effect of PCI on quality of life in patients with stable coronary disease. N Aug 14;359(7):677-87. Among patients with stable angina, both those treated with PCI and those treated with optimal medical therapy alone had marked improvements in health status during follow-up. The PCI

Casas JP, et al. Effect of inhibitors of the **renin-angiotensin system** and other antihypertensive drugs on **renal outcomes**: systematic review and meta-analysis. Lancet. 2005 Dec 10;366(9502):2026-2033. INTERPRETATION: The benefits of ACE inhibitors or ARBs on renal outcomes in placebo-controlled trials probably result from a blood-pressure-lowering effect. In patients with diabetes, additional renoprotective actions of these substances beyond lowering blood pressure remain unproven, and there is uncertainty about the greater renoprotection seen in non-diabetic renal disease.

Haskell WL, Lee IM, Pate RR, Powell KE, Blair SN, Franklin BA, Macera CA, Heath GW, Thompson PD, Bauman A. **Physical Activity** and Public Health. Updated Recommendation for Adults From the American College of Sports Medicine and the American Heart Association. (**AHA**) Circulation. 2007 Aug 1; [Epub ahead of print] To promote and maintain health, all healthy adults aged 18 to 65 yr need moderate-intensity aerobic (endurance) physical activity for a minimum of 30 min on five days each week or vigorous-intensity aerobic physical activity for a minimum of 20 min on three days each week. [I (A)] Combinations of moderate- and vigorous-intensity activity can be performed to meet this recommendation. [IIa (B)] For example, a person can meet the recommendation by walking briskly for 30 min twice during the week and then jogging for 20 min on two other days. Moderate-intensity aerobic activity, which is generally equivalent to a brisk walk and noticeably accelerates the heart rate, can be accumulated toward the 30-min minimum by performing bouts each lasting 10 or more minutes.

Heran BS, Musini VM, Bassett K, et al. **Angiotensin receptor blockers for heart failure**. Cochrane Database Syst Rev. 2012 Apr 18;4:CD003040. In patients with symptomatic HF and systolic dysfunction or with preserved ejection fraction, ARBs compared to placebo or ACEIs do not reduce total mortality or morbidity. ARBs are better tolerated than ACEIs but do not appear to be as safe and well tolerated as placebo in terms of withdrawals due to adverse effects. Adding an ARB in combination with an ACEI does not reduce total mortality or total hospital admission but increases withdrawals due to adverse effects compared with ACEI alone.
Hippisley-Cox J., Coupland C. Effect of combinations of drugs on all cause mortality in patients with ischaemic heart disease: nested case-control analysis. BMJ 2005;330:1059-1063 (7 May), doi:10.1136/bmj.330.7499.1059. Conclusions: Combo of statins, aspirins, & beta-blockers improve survival in high risk pts with cardiovascular dx, although the addition of an angiotensin converting enzyme inhibitor conferred no additional benefit despite the analysis being adjusted for congestive cardiac failure.
Hippisley-Cox J, Coupland C, Vinogradova Y, Robson J, May M, Brindle P. Derivation and validation of **QRISK**, a new cardiovascular disease risk score for the United Kingdom: prospective open cohort study. BMJ. 2007 Jul 5; [Epub ahead of print] Using QRISK 8.5% of patients aged 35-74 are at high risk (20% risk or higher over 10 years) compared with 13% when using the Framingham algorithm and 14% when using ASSIGN. Using QRISK 34% of women and 73% of men aged 64-75 would be at high risk compared with 24% and 86% according to the Framingham algorithm. UK estimates for 2005 based on QRISK give 3.2 million patients aged 35-74 at high risk, with the Framingham algorithm predicting 4.7 million and ASSIGN 5.1 million.

Hollingsworth JM, et al. Medical therapy to **facilitate urinary stone passage**: a meta-analysis. Lancet. 2006 Sep 30;368(9542):1171-9. Patients given calcium-channel blockers or alpha blockers had a 65% (absolute risk reduction=0.31 95% CI 0.25-0.38) greater likelihood of stone passage than those not given such treatment (pooled risk ratio 1.65; 95% CI 1.45-1.88). The pooled risk ratio for alpha blockers was 1.54 (1.29-1.85) and for calcium-channel blockers with steroids was 1.90 (1.51-2.40). (InfoPOEMs: The limited amount of available data suggest that alpha blockers and calcium channel blockers appear to speed the passage of kidney stones. Furthermore, it appears that combining these medications with steroids provides additional benefit. (LOE = 1a-))
Holman RR, Paul SK, Bethel MA, Neil HA, Matthews DR. Long-Term Follow-up after Tight Control of Blood Pressure in Type 2 Diabetes. N Engl J Med. 2008 Sep 10. [Epub ahead of print] (**UKPDS 81**) The benefits of previously improved blood-pressure control were not sustained when between-group differences in blood pressure were lost. Early improvement in blood-pressure control in patients with both type 2 diabetes and hypertensi associated with a reduced risk of complications, but it appears that good blood-pressure control must be continued if the benefits are to be maintained.

Hooper L, et al. Risks and benefits of **omega 3 fats** for mortality, cardiovascular disease, and cancer: systematic review. BMJ. 2006 Mar 24; [Epub ahead of print] (Wang C, et al. n-3 Fatty acids from fish or fish-oil supplements, but not alpha-linolenic acid, benefit cardiovascular disease outcomes in primary- and secondary-prevention studies: a systematic review. Am J Clin Nutr. 2006 Jul;84(1):5-17.)

Hooper L, Summerbell CD, Thompson R, et al. **Reduced or modified dietary fat** for preventing cardiovascular disease. Cochrane Database of Systematic Reviews 2011, Issue 7. Art. No.: CD002137. DOI: 10.1002/14651858.CD002137.pub2. The findings are suggestive of a small but potentially important reduction in cardiovascular risk on modification of dietary fat, but not reduction of total fat, in longer trials. Lifestyle advice to all those at risk of cardiovascular disease and to lower risk population groups, should continue to include permanent reduction of dietary saturated fat and partial replacement by unsaturates. The ideal type of unsaturated fat is unclear.

Cochrane Database Syst Rev. 2006 Apr 19;(2):CD004034. There was no convincing evidence from the trials identified that blood pressure lowering prevents the development of dementia or cognitive impairment in hypertensive patients with no apparent prior cerebrovascular disease. There were significant problems identified with analysing the data, however, due to the number of patients lost to follow-up and the number of placebo patients given active treatment. This introduced bias. More robust results may be obtained by analysing one year data to reduce differential drop-out or by conducting a meta-analysis using individual patient data.

Nahas R. **Complementary and alternative** medicine approaches to blood pressure reduction: An evidence-based review. Can Fam Physician. 2008 Nov;54(11):1529-33. Evidence from systematic reviews supports the blood pressure–lowering effects of coenzyme Q10, polyphenol-rich dark chocolate, Qigong, slow breathing, and transcendental meditation. Vitamin D deficiency is associated with hypertension and cardiovascular risk; supplementation lowered blood pressure in 2 trials. Acupuncture reduced blood pressure in 3 trials; in 1 of these it was no better than an invasive placebo. Melatonin was effective in 2 small trials, but caution is warranted in patients taking pharmacotherapy.

Ohkubo T, Kikuya M, Metoki H, et al. Prognosis of "masked" hypertension & "white-coat" hypertension detected by 24-h **ambulatory blood pressure monitoring** 10-year follow-up from the Ohasama study. J Am Coll Cardiol.2005 Aug 2;46(3):508-15. (InfoPOEMs: Using 24-hour ambulatory blood pressure monitoring as the standard, some patients will have white-coat hypertension (that is, higher blood pressures in the office than at home) and some will also have masked hypertension as a result of lower blood pressure measurements in the office. White-coat hypertension does not confer added risk, but masked hypertension underestimates a patient's risk. Evidence is accumulating that blood pressure should be measured at home, either with a 24-hour monitor or via self-monitoring (J Am Coll Cardiol 2005;46:743-51), before labeling someone as hypertensive and treating them accordingly. Panagiotakos DB, et al. The Relation Between Pulse Pressure & Cardiovascular Mortality in 12 763 Middle-aged Men From Various Parts of the World: A 25-Year Follow-up of the Seven Countries Study. Arch Intern Med. 2005 Oct 10;165(18):2142-7. CONCLUSIONS: Pulse pressure followed by diastolic and systolic blood pressures were the best predictors for CVD mortality among other blood pressures, as well as age, physical activity, total serum cholesterol level, anthropometric indexes, and smoking habits. No significant differences were observed among the different populations studied.
Patel A; ADVANCE Collaborative Group, MacMahon S, Chalmers J, Neal B, et al. Effects of a fixed combination of perindopril and indapamide on macrovascular and microvascular outcomes in patients with type 2 diabetes mellitus (the **ADVANCE** trial): a randomised controlled trial. Lancet. 2007 Sep 8;370(9590):829-40. Routine administration of a fixed combination of perindopril and indapamide to patients with type 2 diabetes was well tolerated and reduced the risks of major vascular events, including death. Although the confidence limits were wide, the results suggest that over 5 years, one death due to any cause would be averted among every 79 patients assigned active therapy. (InfoPOEMs: Perindopril (Aceon) plus indapamide (Lozol) is better than placebo in decreasing clinically relevant events in patients with type 2 diabetes who are at high risk of cardiovascular complications. Whether the combination is better than other medications -- like aspirin -- isn't addressed by this study. (LOE = 1b))

Perez M, Musini V. Pharmacological interventions for **hypertensive emergencies**. Cochrane Database Syst Rev. 2008 Jan 23;(1):CD003653. There is no RCT evidence demonstrating that anti-hypertensive drugs reduce mortality or morbidity in patients with hypertensive emergencies. Furthermore, there is insufficient RCT evidence to determine which drug or drug class is most effective in reducing mortality and morbidity. There were some minor differences in the degree of blood pressure lowering when one class of antihypertensive drug is compared to another. However, the clinical significance is unknown.
Perez MI, Musini VM, Wright JM. Effect of early treatment with **anti-hypertensive drugs on short and long-term mortality in patients with an acute cardiovascular event.** Cochrane Database Syst Rev. 2009 Oct 7;(4):CD006743. Nitrates reduce mortality (4-8 deaths prevented per 1000) at 2 days when administered within 24 hours of symptom onset of an acute myocardial infarction. No mortality benefit was seen when treatment continued beyond 48 hours. Mortality benefit of immediate treatment with ACE inhibitors post MI at 2 days did not reach statistical significance but the effect was significant at 10 days (2-4 deaths prevented per 1000). There is good evidence for lack of a mortality benefit with immediate or short-term treatment with beta-blockers and calcium channel blockers for acute myocardial infarction.

Taylor RS, Ashton KE, Moxham T, et al. **Reduced dietary salt** for the prevention of cardiovascular disease. Cochrane Database of Systematic Reviews 2011, Issue 7. Art. No.: CD009217. DOI: 10.1002/14651858.CD009217. Despite collating more event data than previous systematic reviews of randomised controlled trials (665 deaths in some 6,250 participants), there is still insufficient power to exclude clinically important effects of reduced dietary salt on mortality or cardiovascular morbidity in normotensive or hypertensive populations. Further RCT evidence is needed to confirm whether restriction of sodium is harmful for people with heart failure. Our estimates of benefits from dietary salt restriction are consistent with the predicted small effects on clinical events attributable to the small blood pressure reduction achieved.

The angiotensin-converting enzyme inhibitor (ACEI) ramipril and the angiotensin receptor blocker (ARB) telmisartan are equally effective for secondary cardiovascular prevention. The combination of both drugs is no more effective and causes more adverse effects at greater cost. ACEIs should remain the drug of choice for secondary prevention in high risk cardiovascular patients unless the drug is not tolerated because of angioedema or cough, in which case ARBs provide an effective alternative. (LOE = 1b). Mann JF, Schmieder RE, McQueen M, Dyal L, Schumacher H, Pogue J, Wang X, et al.; ONTARGET investigators. Renal outcomes with telmisartan, ramipril, or both, in people at high vascular risk (the ONTARGET study): a multicentre, randomised, double-blind, controlled trial. Lancet. 2008 Aug 16;372(9638):547-53. In people at high vascular risk, telmisartan's effects on major renal outcomes are similar to ramipril. Although combination therapy reduces proteinuria to a greater extent than monotherapy, overall it worsens major renal outcomes. Sleight P, Redon J, Verdecchia P, et al.; on behalf of the ONTARGET investigators. Prognostic value of blood pressure in patients with high vascular risk in the Ongoing Telmisartan Alone and in combination with Ramipril Global Endpoint Trial study. J Hypertens. 2009 Jun 5. [Epub ahead of print] In high-risk patients, the benefits from SBP lowering below 130 mmHg are driven mostly by a reduction of stroke; myocardial infarction is unaffected and cardiovascular mortality is unchanged or increased. Future trials should be designed to test the value of SBP lowering in high-risk patients with SBP in the range of 130-150 mmHg. { FDA July/09: After carefully weighing the evidence, a US Food and Drug Administration advisory panel voted unanimously against expanding the indication for the angiotensin receptor blocker (ARB) telmisartan (Micardis, Boehringer Ingelheim Pharmaceuticals) for the reduction of cardiovascular events in high-risk patients. The decision, however, does provide physicians with an alternative first-line treatment in patients 55 years or older intolerant to ACE inhibitors but who are at high risk for cardiovascular events. In these patients, the Cardiovascular and Renal Drugs Advisory Committee voted 5 to 2 in favor of approving telmisartan to reduce the risk of MI, stroke, death from cardiovascular causes, or hospitalization for congestive heart failure. Complicating the whole affair was the fact that Boehringer Ingelheim and the FDA failed to come to an agreement in 2001 regarding the statistical plan for the noninferiority end point to determine efficacy. The sponsor chose a margin of 13%, or a hazard ratio of 1.13, which the FDA considered too liberal. Instead, the agency wanted a more conservative margin of 8%, or a hazard ratio of 1.08. Dr Salim Yusuf (McMaster University, Hamilton, ON), the lead investigator of the ONTARGET study, defended the decision to adopt the liberal noninferiority margin, noting that while his approach to clinical trials is to conduct the largest study possible, the margin requested by the FDA would have doubled ONTARGET to more than 50 000 patients, something that just wasn't feasible}

Concluding comments:

Dabigatran (RELY)

RELY has been criticized for it's open label design. Tolerance is an issue with the higher discontinuation rates than warfarin driven by dyspepsia. The tartaric acid in the formulation is likely driving the increased dyspepsia rates. Although not statistically significant after re-analysis, the increasing trend for MIs is worrisome. The 150mg dosage has the best NNT for the stroke and systemtic embolism, hemorrhagic stroke and the only statistically significant NNT for ischemic stroke. The 110mg dosage may be appropriate for those at high risk for major bleeding.

Rivaroxaban (ROCKET-AF)

The trial design was superior to RELY in that it was double blinded with sham INR for both comparator and control groups. Their patient population was also sicker with $CHADS_2$ score mean of 3.4 compared to 2.1-2.2 from RELY. However, a criticism has been that the time within TTR (INR2-3) for the warfarin group was only 55%, which is lower than RELY and ROCKET-AF. This is understandable because sicker patients are more difficult to dose to TTR with warfarin. Also rivaroxaban was shown to be non-inferior to warfarin for the intention to treat analysis and was only superior in the per protocol group. As far as efficacy for the primary endpoint, it could be considered second to last before dabigatran 110mg dosage.

Apixaban (ARISTOLE)

This drug reduced all cause mortality compared to warfarin, which is already a very efficacious drug. This endpoint trumps the other two trials. On the safety side there is 30% less major bleeding (a combination of less intracranial and a decreasing trend for GI bleeds). It has not yet been approved in Canada or the US for stroke prevention in AF patients.

Recommendations for the prevention of stroke in patients with atrial fibrillation

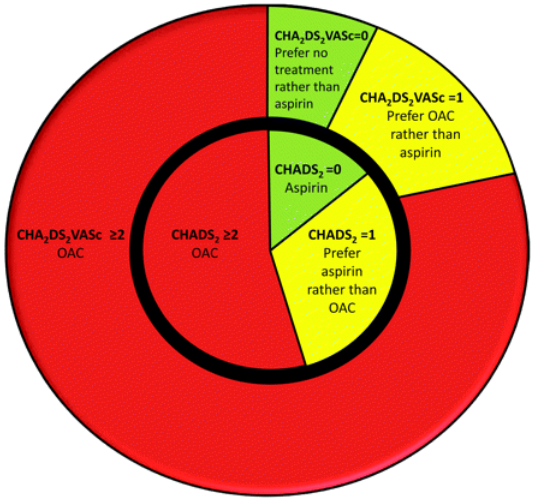

Figure. Recommendations for the prevention of stroke in patients with atrial fibrillation. The inner circle represents treatment recommendations based on the use of the $CHADS_2$ score, as in US guidelines. The outer circle represents recommendations based on the CHA_2DS_2–VASc model, as outlined in the European guidelines, which advise anticoagulant therapy in a larger proportion of patients with atrial fibrillation. Bleeding risk assessment is recommended for patients at intermediate stroke risk (yellow-shaded area), with particular caution and regular patient review for those on warfarin therapy when the HAS-BLED (hypertension, abnormal renal/liver function, stroke, bleeding history or predisposition, labile international normalized ratio, elderly, drugs/alcohol concomitantly) score is ≥3. For patients at very high risk of bleeding (eg, those with malignant hypertension or prior episodes of major bleeding), conservative monitoring without treatment should be considered. OAC indicates oral anticoagulation.

Management of Recent-Onset AF & Flutter in the Emergency Department (ED):[52]

- Rate-control vs. Rhythm Control Treatment (Tx)
- Rate Control Tx = ventricular rate control, oral anticoagulation, no attempt to return the patient to sinus rhythm in the ED, & delayed cardioversion after 4 weeks, if indicated
- Rhythm Control Tx = cardiovert patients to sinus rhythm in ED (pharmacologically or electrically), then discharge home in sinus rhythm

Luo JC, Huang KW, Leu HB, et al. Randomised clinical trial: **rabeprazole plus aspirin is not inferior to rabeprazole plus clopidogrel** for the healing of aspirin-related peptic ulcer. Aliment Pharmacol Ther. 2011 Sep;34(5):519-25.
53. Ridker PM, et al. A Randomized Trial of Low-Dose Aspirin in the Primary Prevention of Cardiovascular Disease in Women (**WHS**). N Engl J Med. 2005 Mar 7 pre release electronic;352. N Engl J Med 2005;352:1293-304.
(InfoPOEMs: Aspirin reduces the risk of stroke and transient ischemic attack in women but does not reduce the risk of myocardial infarction or cardiovascular death. The reduction in strokes over 10 years (number needed to treat = 444) must be balanced against an increase in serious gastrointestinal bleeds (number needed to treat to harm = 553). No change was seen in this large, long study regarding all-cause mortality. (LOE = 1b)) {Low dose Aspirin in the Primary Prevention of Cancer WHS study JAMA. 2005;294:47-55. Conclusions: Results from this large scale, long-term trial suggest that alternate day use of 100mg every other day for an average of 10yrs does not lower the risk of total, breast, colorectal, or other site-specific cancers. A protective effect on lung cancer or a benefit of higher doses of aspirin cannot be ruled out}
Kurth T, Barr RG, Gaziano JM, Buring J. Randomised Aspirin Assignment And Risk Of Adult-Onset Asthma In The Women's Health Study. (**WHS**) Thorax. 2008 Mar 13; [Epub ahead of print] In this large, randomised clinical trial of apparently healthy adult women, assignment of 100 mg of aspirin on alternate days reduced the relative risk of newly reported diagnosis of **asthma**.
54. Gage BF, van Walraven C, Pearce L, et al. Selecting patients with atrial fibrillation for anticoagulation: Stroke risk stratification in patients taking aspirin. Circulation 2004; 110:2287-92. (InfoPOEMs: Clinical decision rules, especially the well-validated Stroke Prevention in Atrial Fibrillation (SPAF) score, can help identify which groups of patients with atrial fibrillation are likely and unlikely to benefit from anticoagulation. (LOE = 1a).If the risk of stroke is low (< 2%), the harms of anticoagulation generally outweigh the benefits. If the risk of stroke is high (> 4%), the benefits of anticoagulation outweigh the risks for most pts. If the patient's stroke risk is in between both extremes, we have to look carefully at his or her risk for hemorrhage.)
55. Sabatine MS, et al. Addition of Clopidogrel to Aspirin and Fibrinolytic Therapy for Myocardial Infarction with ST-Segment Elevation (**CLARITY-TIMI 28**). N Engl J Med. 2005 Mar 9; [Epub] (N=3491,Groups: Plavix 300mg x1 then 75mg od (median **4 doses** given) until angiography vs placebo had 30 day mortality of less than 5%, age <75yr, excluded high bleeding risk pts, few CABG performed, thus select pts were studied, mechanism may be to prevent reocclusion) (InfoPOEMs: Adding clopidogrel to aspirin and fibrinolytic therapy during the first week in patients with ST-segment elevation myocardial infarction reduces the likelihood of recurrent myocardial infarction and ischemia leading to revascularization over a 30-day period (number needed to treat = 15). The short-term risk of major bleeding was low. This trial does not address how long patients should continue to take clopidogrel after the first week of treatment. (LOE = 1b)) {Sabatine MS, Cannon CP, Gibson CM, et al.; Clopidogrel as Adjunctive Reperfusion Therapy (CLARITY)-Thrombolysis in Myocardial Infarction (TIMI) 28 Investigators. Effect of clopidogrel pretreatment before percutaneous coronary intervention in patients with ST-elevation myocardial infarction treated with fibrinolytics: the **PCI-CLARITY** study. JAMA. 2005 Sep 14;294(10):1224-32. Epub 2005 Sep 4. CONCLUSIONS: Clopidogrel pretreatment significantly reduces the incidence of cardiovascular death or ischemic complications both before and after PCI and without a significant increase in major or minor bleeding. These data add further support to the early use of clopidogrel in STEMI and the strategy of routine clopidogrel pretreatment in patients undergoing PCI. (InfoPOEMs: Pretreatment with clopidogrel before percutaneous coronary intervention (PCI) reduces the risk of cardiovascular disease complications without increasing the risk of bleeding complications. This study only followed patients for 30 days after the intervention, so further long-term studies are needed before a general recommendation can be made. (LOE = 1b-)) } (Scirica BM, et al. The role of clopidogrel in early & sustained arterial patency after fibrinolysis for ST-segment elevation MI: the ECG CLARITY-TIMI 28 Study. J Am Coll Cardiol. 2006 Jul 4;48(1):37-42. Epub 2006Jun 12.)
56. Chen ZM, Jiang LX, Chen YP, et al. **COMMIT** (ClOpidogrel and Metoprolol in Myocardial Infarction Trial) collaborative group. Addition of clopidogrel to aspirin in 45,852 patients with acute myocardial infarction: randomised placebo-controlled trial. Lancet. 2005 Nov 5;366(9497):1607-21. COMMIT/CCS-2 trial (Mean age 61, n=45,852, <24hr since MI symptom onset, primary PCI or high risk bleeding were excluded, 54% rec'd thrombolysis, Plavix 75mg od + ASA162mg od vs ASA 162mg od for a mean of **15 days**, Death/MI/stroke 9.2 vs 10.1%, Death 7.5 vs 8.1%, Major Bleeding both equal ~0.6%, Minor bleeds 3.6 vs 3.1%) INTERPRETATION: In a wide range of patients with acute MI, adding clopidogrel 75 mg daily to aspirin and other standard treatments (such as fibrinolytic therapy) safely reduces mortality and major vascular events in hospital, and should be considered routinely.(InfoPOEMs: Patients with acute myocardial infarction treated with aspirin plus clopidogrel have better in-hospital or 28-day survival and fewer deaths, reinfarctions, or strokes than patients treated with aspirin alone. This study doesn't tell us if patients are better off 6 months to 1 year after their myocardial infarction. (LOE = 1b))
57. Chimowitz MI, Lynn MJ, Howlett-Smith H, et al.; Warfarin-Aspirin Symptomatic Intracranial Disease Trial Investigators. Comparison of warfarin and **aspirin** for symptomatic intracranial arterial stenosis. (**WASID**). N Engl J Med. 2005 Mar 31;352(13):1305-16. (InfoPOEMs: Warfarin instead of aspirin causes 1 extra death every 2 years for patients with **intracranial arterial stenosis** and a recent stroke or transient ischemic attack. Given the risk and cost of the imaging studies done to diagnose intracranial arterial stenosis, one has to wonder whether we should just prescribe 650 mg aspirin twice a day for these patients and leave it at that. 68. Quiroz R, Kucher N, Zou KH, et al. Clinical validity of a negative computed tomography scan in patients with suspected pulmonary embolism. A systematic review. JAMA 2005; 293:2012-17. (InfoPOEMs: A negative computed tomography (CT) scan is as accurate as pulmonary angiography in ruling out suspected pulmonary embolism (PE). Clinicians should strongly consider using clinical decision rules to accurately assess the pretest probability of PE in a individual patient, and then interpret diagnostic tests in light of this probability. For example, a negative CT in a low-risk patient rules out PE, while a negative CT in a high-risk patient may require further confirmation. (LOE = 2a-))
69. Christiansen SC, Cannegieter SC, et al. Thrombophilia, clinical factors, and recurrent venous thrombotic events. JAMA 2005; 293:2352-61. (InfoPOEMs: The risk of recurrence after a first venous thrombotic event (VTE) is increased in men, patients whose

TOP

idiopathic, and women using oral contraceptives after the initial VTE. This study found no increased risk for recurrence in patients with prothrombotic abnormalities. Testing for prothrombotic abnormalities should be considered only in patients with a recurrent VTE. (LOE = 1b-))

70. Perrier A, Roy PM, Sanchez O, et al. **Multidetector-row computed tomography** in suspected pulmonary embolism. N Engl J Med 2005; 352:1760-68. (InfoPOEMs: An algorithm that includes a careful, structured clinical assessment (D-dimer, lower extremity ultrasound, and multidetector-row computed tomography depending on risk status, and other testing as needed based on this initial assessment) provides a safe, and presumably cost-effective, evaluation for patients with suspected pulmonary embolism (PE). The authors argue that omitting the lower extremity ultrasound is a reasonable option given its low yield in this study, although further evaluation of that step is needed in subsequent studies. (LOE = 1a))
71. Witt DM, Sadler MA, Shanahan RL, Mazzoli G, Tillman DJ. Effect of a centralized clinical **pharmacy anticoagulation service** on the outcomes of anticoagulation therapy. Chest. 2005 May;127(5):1515-22.
72. Ost D, Tepper J, Mihara H, Lander O, Heinzer R, Fein A. **Duration of anticoagulation** following venous thromboembolism: a meta-analysis. JAMA. 2005 Aug 10;294(6):706-15. CONCLUSIONS: Patients who receive extended anticoagulation are protected from recurrent VTE while receiving long-term therapy. The clinical benefit is maintained after anticoagulation is discontinued, but the magnitude of the benefit is less pronounced. (InfoPOEMs: The optimal duration of anticoagulation following an initial venous thromboembolism (VTE) event is 6 months or more. The risk of a major bleeding event is most pronounced in the first month of treatment and the rate is similar to short-term (3 months or less) treatment. Since the magnitude of benefit appears to lessen beyond 6 months, physicians and patients should reassess individual risk/benefit profiles beyond this timeframe. (LOE = 1a))

75. Cook NR, Lee IM, Gaziano JM, Gordon D, Ridker PM, Manson JE, Hennekens CH, Buring JE. Low-dose **aspirin** in the primary prevention of **cancer**: the Women's Health Study (WHS) : a randomized controlled trial. JAMA. 2005 Jul 6;294(1):47-55. Results from this large-scale, long-term trial suggest that alternate day use of low-dose aspirin (100 mg) for an average 10 years of treatment does not lower risk of total, breast, colorectal, or other site-specific cancers. A protective effect on lung cancer or a benefit of higher doses of aspirin cannot be ruled out. (InfoPOEMs: Low-dose aspirin does not reduce the risk of lung, breast, colorectal, or other site cancer in healthy women 45 years and older. There may be a protective effect on reducing lung cancer mortality, but overall mortality is not reduced. (LOE = 1b))
76. Andrew T. Chan, MD, MPH; Edward L. et al. Long-term Use of Aspirin and Nonsteroidal Anti-inflammatory Drugs and Risk of Colorectal Cancer JAMA. 2005;294:914-923. CONCLUSIONS: Regular, long-term aspirin use reduces risk of colorectal cancer. Nonaspirin NSAIDs appear to have a similar effect. However, a significant benefit of aspirin is not apparent until more than a decade of use, with maximal risk reduction at doses greater than 14 tablets per week. These results suggest that optimal chemoprevention for colorectal cancer requires long-term use of aspirin doses substantially higher than those recommended for prevention of cardiovascular disease, but the dose-related risk of gastrointestinal bleeding must also be considered. (InfoPOEMs: Regular use of aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs), especially more than 14 doses per week for at least 10 years, reduces the risk of colon cancer while also increasing the risk of a major gastrointestinal bleeding event. All-cause mortality is not affected by regular use. We need additional methods (gene testing?) to determine who is at high risk of colorectal cancer before making specific recommendations for prevention. (LOE = 2b))
77. Goodacre S, Sutton AJ, Sampson FC. Meta-analysis: The value of clinical assessment in the diagnosis of deep venous thrombosis. Ann Intern Med. 2005 Jul 19;143(2):129-39. CONCLUSION: Individual clinical features are of limited value in diagnosing DVT. Overall assessment of clinical probability by using the Wells score is more useful. (InfoPOEMs: With the exception of either a previous deep vein thrombosis (DVT) or a previous malignancy, no other clinical feature effectively increases or decreases the odds of having a DVT. The Wells Clinical Probability Score, which combines several clinical features, is much more effective. (LOE = 1a))

122. Berger JS, et al. **Aspirin for the primary** prevention of cardiovascular events in women and men: a sex-specific meta-analysis of randomized controlled trials. JAMA. 2006 Jan 18;295(3):306-13. CONCLUSIONS: For women and men, aspirin therapy reduced the risk of a composite of cardiovascular events due to its effect on reducing the risk of ischemic stroke in women and MI in men. Aspirin significantly increased the risk of bleeding to a similar degree among women and men. (InfoPOEMs: Primary prevention with aspirin reduces the risk of adverse cardiovascular events in both women and men. In particular, aspirin reduces the risk of stroke in women and the risk of myocardial infarction (MI) in men. The risk of major bleeding is significantly increased with regular aspirin therapy in both sexes and overall mortality is unchanged. Patients and their clinicians should weigh their independent risks and benefits before deciding on regular aspirin use. (LOE = 1a))

169. Gage BF, van Walraven C, Pearce L, et al. Selecting patients with atrial fibrillation for anticoagulation: Stroke risk stratification in patients taking aspirin. Circulation 2004; 110:2287-92. (InfoPOEMs: Clinical decision rules, especially the well-validated Stroke Prevention in Atrial Fibrillation (SPAF) score, can help identify which groups of patients with atrial fibrillation are likely and unlikely to benefit from anticoagulation. (LOE = 1a).If the risk of stroke is low (< 2%), the harms of anticoagulation generally outweigh the benefits. If the risk of stroke is high (> 4%), the benefits of anticoagulation outweigh the risks for most pts. If the patient's stroke risk is in between both extremes, we have to look carefully at his or her risk for hemorrhage.)
Cooper NJ, Sutton AJ, Lu G, Khunti K. Mixed comparison of stroke prevention treatments in individuals with **nonrheumatic atrial fibrillation**. Arch Intern Med. 2006 Jun 26;166(12):1269-75. A lower rate of ischemic stroke and a higher rate of major bleeding episodes were found to be associated with oral anticoagulants compared with aspirin, and both anticoagulants and aspirin were found to be associated with a reduction in the rate of stroke compared with placebo. Assuming a baseline risk of 51 ischemic stroke events per 1000 person-years, it can be estimated that adjusted standard-dose warfarin could prevent 28 (95% CrI, -37 to -19) ischemic strokes at the expense of 11 (95% CrI, -1 to +39) major or fatal bleeding episodes. In comparison, aspirin could prevent 16 (95% CrI, -26 to -5) ischemic strokes at the expense of 6 (95% CrI, -3 to +27) major or fatal bleeding episodes. N Engl J Med. 2006 Aug 10;355(6):549-59. (InfoPOEMs: High-dose atorvastatin reduces the risk of recurrent stroke, but does not improve mortality rates. A reduction in the risk of transient ischemic attack (TIA) or unclassified stroke was partially offset by an increase in the risk of hemorrhagic stroke. (LOE = 1b)) Amarenco P, Goldstein LB, Szarek M, Sillesen H, Rudolph AE, Callahan A 3rd, Hennerici M, Simunovic L, Zivin JA, Welch KM; SPARCL Investigators. Effects of Intense Low-Density Lipoprotein Cholesterol Reduction in Patients With Stroke or Transient Ischemic Attack. The Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial. Stroke. 2007 Oct 25; [Epub ahead of print] As compared with having no change or an increase in LDL-C, achieving a >/=50% lowering was associated with a greater reduction in the risk of stroke and major coronary events with no increase in brain hemorrhages. Goldstein LB, Amarenco P, Szarek M, Callahan A 3rd, Hennerici M, Sillesen H, Zivin JA, Welch KM; On behalf of the SPARCL Investigators. Hemorrhagic stroke in the Stroke Prevention by Aggressive Reduction in Cholesterol Levels study. Neurology. 2007 Dec 12; [Epub ahead of print] Hemorrhagic stroke was more frequent in those treated with atorvastatin, in those with a hemorrhagic stroke as an entry event, in men, and increased with age. Those with Stage 2 hypertension at the last visit prior to the hemorrhagic stroke were also at increased risk. Treatment did not disproportionately affect the hemorrhagic stroke risk associated with these other factors. There were no relationships between hemorrhage risk and baseline low-density lipoprotein (LDL) cholesterol level or recent LDL cholesterol level in treated patients.
Sillesen H, Amarenco P, Hennerici MG, et al. on Behalf of the SPARCL Investigators. Atorvastatin Reduces the Risk of Cardiovascular Events in Patients With Carotid Atherosclerosis. A Secondary Analysis of the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial. Stroke. 2008 Oct 9. [Epub ahead of print] Consistent with the overall results of the SPARCL intention to treat population, intense lipid lowering with atorvastatin reduced the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis. The carotid stenosis group may have greater benefit.
Amarenco P, Benavente O, Goldstein LB, et al.; on behalf of the SPARCL Investigators. Results of the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial by Stroke Subtypes. Stroke. 2009 Feb 19. [Epub ahead of print] Atorvastatin 80 mg/d is similarly efficacious in preventing strokes and other cardiovascular events, irrespective of baseline ischemic stroke subtype.

181. Eisenstein EL, Anstrom KJ, Kong DF, et al. **Clopidogrel use** and long-term clinical outcomes after **drug-eluting stent** implantation. JAMA 2006; 297:DOI:10.1001/jama.297.2.joc60179. Available at: http://jama.ama-assn.org. The extended use of clopidogrel in patients with DES may be associated with a reduced risk for death and death or MI. However, the appropriate duration for clopidogrel administration can only be determined within the context of a large-scale randomized clinical trial.
182. Pfisterer M, Brunner-La Rocca HP, Buser PT, et al. Late clinical events after **clopidogrel discontinuation** may limit the benefit of **drug-eluting stents**. J Am Coll Cardiol 2006; 48:2584-2591. The primary focus of this observation was cardiac death/MI. Rates of 18-month cardiac death/MI were not different between DES and BMS patients. However, after the discontinuation of clopidogrel (between months 7 and 18), these events occurred in 4.9% after DES vs 1.3% after BMS implantation. Target vessel revascularization remained lower after DES, resulting in similar rates of all clinical events for this time period (DES 9.3%, BMS 7.9%). Documented late stent thrombosis & related death/target vessel MI were twice as frequent after DES versus BMS (2.6% vs. 1.3%).

216. Hallas J, et al. Use of **single and combined antithrombotic therapy and risk of serious upper gastrointestinal bleeding**: population based case-control study. BMJ. 2006 Sep 19; [Epub ahead of print] Adjusted odds ratios associating drug use with upper gastrointestinal bleeding were 1.8 (95% confidence interval 1.5 to 2.1) for low dose aspirin, 1.1 (0.6 to 2.1) for clopidogrel, 1.9 (1.3 to 2.8) for dipyridamole, and 1.8 (1.3 to 2.4) for vitamin K antagonists. Corresponding figures for combined use were 7.4 (3.5 to 15) for clopidogrel and aspirin, 5.3 (2.9 to 9.5) for vitamin K antagonists and aspirin, and 2.3 (1.7 to 3.3) for dipyridamole and aspirin.
217. Gibson CM, et al.; **TIMI** Study Group. Usefulness of **Clopidogrel** in Abolishing the Increased Risk of Reinfarction Associated With **Higher Platelet Counts** in Patients With ST-Elevation Myocardial Infarction (Results from **CLARITY-TIMI 28**). 220. McQuaid KR, et al. Systematic review and meta-analysis of **adverse events of low-dose aspirin and clopidogrel** in randomized controlled trials. Am J Med. 2006 Aug;119(8):624-38. Aspirin increased the risk of major bleeding (RR=1.71; 95% confidence interval [CI], 1.41-2.08), major gastrointestinal (GI) bleeding (RR=2.07; 95% CI, 1.61-2.66), and intracranial bleeding (RR=1.65; 95% CI, 1.06-5.99) versus placebo. No difference between 75-162.5 mg/day and >162.5-325 mg/day aspirin versus placebo was seen. The absolute annual increases attributable to aspirin were major bleeding: 0.13% (95% CI, 0.08-0.20); major GI bleeding: 0.12% (95% CI, 0.07-0.19), intracranial bleeding: 0.03% (95% CI, 0.01-0.08). No study compared clopidogrel with placebo. One study showed increased major GI bleeding (but not non-GI bleeding endpoints) with aspirin versus clopidogrel (RR=1.45; 95% CI, 1.00-2.10). The absolute annual increase was 0.12% (95% CI, 0.00-0.28). CONCLUSIONS: Low-dose aspirin increases the risk of major bleeding by approximately 70%, but the absolute increase is modest: 769 patients (95% CI, 500-1250) need to be treated with aspirin to cause one additional major bleeding episode annually. Compared with clopidogrel, aspirin increases the risk of GI bleeding but not other bleeding; however, 883 patients (95% CI, 357-infinity) would need to be treated with clopidogrel versus aspirin to prevent one major GI bleeding episode annually at a cost of over 1 million dollars.
221. Laine L. Review article: **gastrointestinal bleeding with low-dose aspirin** - what's the risk? Aliment Pharmacol Ther. 2006 Sep 15;24(6):897-908. The single endoscopic trial assessing ulcers showed no significant difference in 12-week ulcer incidence: 6% of 381 given placebo vs. 7% of 387 given 81 mg enteric-coated aspirin. The relative risk of major gastrointestinal bleeding with low-dose aspirin in a meta-analysis of placebo-controlled trials of vascular protection was 2.07 (95% CI: 1.61-2.66). The absolute rate increase with aspirin above placebo was 0.12% per year (95% CI: 0.07-0.19%) with a number-needed-to-harm of 833 patients (95% CI: 526-1429). A meta-analysis of aspirin 50-1500 mg daily reported an odds ratio for any gastrointestinal bleeding of 1.68 (95% CI: 1.51-1.88) with an number-needed-to-harm at 1 year of 247. The relative risk of hospitalization for upper gastrointestinal bleeding with low-dose aspirin in a large Danish cohort study was 2.6 (95% CI: 2.2-2.9) with an absolute annual incidence of 0.6%. Factors that may increase the risk of gastrointestinal bleeding include prior history of ulcers or gastrointestinal bleeding, corticosteroid use, anticoagulant therapy and addition of a non-aspirin non-steroidal anti-inflammatory drug.

234. Aguilar M, Hart R. **Antiplatelet therapy** for preventing stroke in patients with non-valvular **atrial fibrillation** and no previous history of stroke or transient ischemic attacks. Cochrane Database Syst Rev. 2005 Oct 19;(4):CD001925. Aspirin appears to reduce stroke and major vascular events in patients with non-valvular AF similar to its effect in other high-risk patients (ie by about 25%). For primary prevention among AF patients with an average stroke rate of 4% per year, about 10 strokes would likely be prevented yearly for every 1000 AF patients given aspirin.
235. Aguilar MI, Hart R. **Oral anticoagulants** for preventing stroke in patients with non-valvular **atrial fibrillation** and no previous history of stroke or transient ischemic attacks. Cochrane Database Syst Rev. 2005 Jul 20;(3):CD001927. Treatment with adjusted-dose warfarin to achieved INRs of 2 to 3 reduces stroke, disabling or fatal stroke, and death for patients with non-valvular AF. The benefits were not substantially offset by increased bleeding among these participants in randomized clinical trials. Limitations include relatively short follow up and imprecise estimates of bleeding risks from the selected participants enrolled in the trials. For primary prevention of stroke in AF patients, about 25 strokes and about 12 disabling or fatal strokes would be prevented yearly for every 1000 atrial fibrillation patients given OACs.

274. Campbell CL, Smyth S, Montalescot G, and Steinhubl SR. Aspirin dose for the prevention of cardiovascular disease. A systematic review. JAMA 2007; 297:2018-2024. Currently available clinical data do not support the routine, long-term use of aspirin dosages greater than 75 to 81 mg/d in the setting of cardiovascular disease prevention. Higher dosages, which may be commonly prescribed, do not better prevent events but are associated with increased risks of gastrointestinal bleeding.
275 Hylek EM, Evans-Molina C, Shea C, Henault LE, Regan S. **Major hemorrhage** and tolerability of **warfarin** in the first year of therapy among **elderly** patients with atrial fibrillation. Circulation. 2007 May 29;115(21):2689-96. Epub 2007 May 21. {InfoPOEMs: The risk of major hemorrhage among older patients taking warfarin is higher than commonly reported (13.7% during the first year for patients aged 80 and older) and particularly in the first 3 months of treatment. If the decision is made to use anticoagulation, patients should be aware of the risks, the early warning signs of bleeding, and should be followed up closely during the first 3 months in particular to assure that the international normalized ratio (INR) does not exceed 3.0. (LOE = 2b)}
276. Aguilar M, Hart R, Pearce L. Oral anticoagulants versus antiplatelet therapy for preventing stroke in patients with non-valvular atrial fibrillation and no history of stroke or transient ischemic attacks. Cochrane Database Syst Rev. 2007 Jul 18;3:CD006186. Adjusted-dose warfarin and related oral anticoagulants reduce stroke, disabling stroke and other major vascular events for those with non-valvular AF by about one third when compared with antiplatelet therapy.
277. Spencer FA, Lessard D, Emery C, et al. **Venous thromboembolism in the outpatient setting**. Arch Intern Med. 2007 Jul 23;167(14):1471-5. In all, 73.7% of patients developed VTE in the outpatient setting; a substantial proportion of these patients had undergone surgery (23.1%) or hospitalization (36.8%) in the preceding 3 months. More VTEs were diagnosed in the 3 months following hospitalization than during hospitalization. Efforts to improve in-hospital use of VTE prophylaxis may help decrease the incidence of outpatient VTE.
278. Wein L, Wein S, Haas SJ, Shaw J, et al. Pharmacological Venous **Thromboembolism Prophylaxis** in **Hospitalized Medical Patients**: A **Meta-analysis** of Randomized Controlled Trials. Arch Intern Med. 2007 Jul 23;167(14):1476-1486. A UFH dosage of 5000 U 3 times daily was more effective in preventing DVT than a UFH dosage of 5000 U twice daily when compared with the control (RR, 0.27; 95% CI, 0.20-0.36; vs RR, 0.52; 95% CI, 0.28-0.96). Both UFH and LMWH reduce venous thromboembolic risk in hospitalized medical patients, but neither agent alters mortality. When directly compared, LMWH is more effective in preventing DVT.
279. Warfarin Antiplatelet Vascular Evaluation Trial Investigators (**WAVE**), Anand S, Yusuf S, Xie C, Pogue J, Eikelboom J, Budaj A, Sussex B, Liu L, Guzman R, Cina C, Crowell R, Keltai M, Gosselin G. Oral anticoagulant and antiplatelet therapy and peripheral arterial disease. N Engl J Med. 2007 Jul 19;357(3):217-27. In patients with **peripheral arterial disease**, the combination of an **oral anticoagulant** and antiplatelet therapy was not more effective than antiplatelet therapy alone in preventing major cardiovascular complications and was associated with an increase in life-threatening bleeding.
280. Philbrick JT, Shumate R, Siadaty MS, Becker DM. **Air travel** and venous thromboembolism: a systematic review. J Gen Intern Med. 2007 Jan;22(1):107-14. All travelers, regardless of VTE risk, should avoid dehydration and frequently exercise leg muscles. Travelers on a flight of less than 6 hours and those with no known risk factors for VTE, regardless of the duration of the flight, do not need DVT prophylaxis. Travelers with 1 or more risk factors for VTE should consider graduated compression stockings and/or LMWH for flights longer than 6 hours.

288. Keller T, et al. Clopidogrel plus aspirin versus aspirin alone for preventing cardiovascular disease. Cochrane Database Syst Rev. 2007 Jul 18;(3):CD005158. The available evidence demonstrates that the use of clopidogrel plus aspirin is associated with a reduction in the risk of cardiovascular events compared with aspirin alone in patients with acute non-ST coronary syndrome. In patients at high risk of cardiovascular disease but not presenting acutely, there is only weak evidence of benefit and hazards of treatment almost match any benefit obtained.
289. Delaney JA, Opatrny L, Brophy JM, & Suissa S. **Drug-drug interactions between antithrombotic** medications and the risk of gastrointestinal bleeding. Can Med Assoc J 2007; 177:347-351. The prescribing of acetylsalicylic acid with either clopidogrel (adjusted rate ratio [RR] 3.90, 95% confidence interval [CI] 2.78-5.47) or warfarin (adjusted RR 6.48, 95% CI 4.25-9.87) was associated with a greater risk of gastrointestinal bleeding than that observed with each drug alone. The same was true when a nonsteroidal anti-inflammatory drug was combined with either clopidogrel (adjusted RR 2.93, 95% CI 1.74-4.93) or warfarin (RR 4.60, 95% CI 2.77-7.64). Drug combinations involving antiplatelets and anticoagulants are associated with a high risk of gastrointestinal bleeding beyond that associated with each drug used alone.

292. De Schryver E, Algra A, van Gijn J. **Dipyridamole** for preventing stroke and other vascular events in patients with vascular disease. Cochrane Database Syst Rev. 2007 Jul 18;(3):CD001820. For patients who presented with arterial vascular disease, there was no evidence that dipyridamole, in the presence or absence of another antiplatelet drug reduced the risk of vascular death, though it reduces the risk of further vascular events. This benefit was found only in patients presenting after cerebral ischaemia. There was no evidence that dipyridamole alone was more efficacious than aspirin.
293. Kennedy J, Hill MD, Ryckborst KJ, Eliasziw M, Demchuk AM, Buchan AM; for the **FASTER** Investigators. Fast assessment of stroke and transient ischaemic attack to prevent early recurrence (FASTER): a randomised controlled pilot trial. Lancet Neurol. 2007 Oct 9; [Epub ahead of print] Immediately after TIA or minor stroke, patients are at high risk of stroke, were followed for 90 days, which might be reduced by using clopidogrel in addition to aspirin. The haemorrhagic risks of the combination of aspirin (162mg load then 81mg od) and clopidogrel (300mg load then 75mg od) do not seem to offset this potential benefit. We were unable to provide evidence of benefit of simvastatin (40mg od in evening) in this setting. This aggressive prevention approach merits further study.
294. Rothwell PM, Giles MF, Chandratheva A, et al; on behalf of the Early use of Existing Preventive Strategies for Stroke (**EXPRESS**) study. Effect of urgent treatment of transient ischaemic attack and minor stroke on early recurrent stroke (EXPRESS study): a prospective population-based sequential comparison. Lancet. 2007 Oct 8; [Epub ahead of print] (Drugs used:ASA 300mg x1 then 75mg od, clopidogrel 300mg x1 then 75mg od x 30 days, simvastatin 40mg od, perindopril 4mg od +/- indapamide 1.25mg od) Early initiation of existing treatments after TIA or minor stroke was associated with an 80% reduction in the risk of early recurrent stroke. Further follow-up is required to determine long-term outcome, but these results have immediate implications for service provision and public education about TIA and minor stroke.[300-mg loading dose and subsequent 75-mg daily dose of aspirin. This was combined with a 300-mg loading dose followed by a 75-mg daily dose of **clopidogrel for 30 days**.90-day stroke risk was 10.3% in phase 1 and 2.1% in phase 2 (adjusted hazard ratio, 0.20; P = .0001).]
295. Lavallee PC, Meseguer E, Abboud H, Cabrejo L, Olivot JM, Simon O, Mazighi M, Nifle C, Niclot P, Lapergue B, Klein IF, Brochet E, Steg PG, Leseche G, Labreuche J, Touboul PJ, Amarenco P. 310. Douketis JD, et al. The **risk for fatal pulmonary embolism after discontinuing anticoagulant** therapy for venous thromboembolism. Ann Intern Med. 2007 Dec 4;147(11):766-74. The risk for fatal PE is 0.19 to 0.49 events per 100 person-years for patients who have finished a course of anticoagulant therapy for a first episode of symptomatic VTE. The case-fatality rate for death from recurrent PE is 4% to 9%.
311. Thijs V, Lemmens R, Fieuws S. **Network meta-analysis**: simultaneous meta-analysis of common antiplatelet regimens after transient ischaemic attack or stroke. Eur Heart J. 2008 Mar 17; [Epub ahead of print] In the network meta-analysis, all antiplatelet regimens (aspirin, aspirin plus dipyridamole, thienopyridines, and combination of aspirin and thienopyridines) were significantly more effective than placebo. The combination of aspirin and dipyridamole was more effective than thienopyridines (OR, 0.84; 95% CI, 0.73-0.97) and more effective than aspirin (OR, 0.78; 95% CI, 0.70-0.87). Our analysis suggests that the most powerful antiplatelet regimen in the prevention of serious vascular events after TIA or stroke is the **combination of aspirin and dipyridamole**.
312. O'Donnell MJ, Hankey GJ, Eikelboom JW. Antiplatelet Therapy for **Secondary Prevention** of Noncardioembolic Ischemic Stroke. A Critical Review. Stroke. 2008 Mar 27; [Epub ahead of print] For patients with ischemic stroke or transient ischemic attack caused by atherothromboembolism, immediate & long-term aspirin reduces the relative risk of recurrent stroke, MI, & death attributable to vascular causes. Oral anticoagulation is not more effective than aspirin. Long-term clopidogrel reduces the relative risk of stroke, MI, or vascular death by about 9% (0.3% to 16.5%) compared with aspirin. Any long-term benefits of clopidogrel combined with aspirin, compared with aspirin or clopidogrel alone, appear to be offset by increased major bleeding. The combination of aspirin and extended-release dipyridamole reduces the relative odds of stroke, MI, or vascular death by about 18% (odds ratio 0.82, 0.74 to 0.91) compared with aspirin alone without causing more bleeding. Cilostazole reduces the risk of stroke, MI, or vascular death by 39% compared to placebo. A large clinical trial comparing clopidogrel with the combination of aspirin and dipyridamole, in >20 000 patients with recent (<120 days) atherothrombotic ischemic stroke, is expected to report in 2008. Emerging antiplatelet therapies presently being evaluated for secondary prevention of atherothromboembolism include other P2Y12 ADP receptor antagonists (prasugrel, cangrelor, AZD 6140), thromboxane receptor antagonists (eg, S18886 - terutroban), and thrombin receptor (PAR-1) antagonists (eg, SCH530348).

Hansen Morten L.; Sorensen Rikke; Clausen Mette T.; et al. Risk of Bleeding With Single, Dual, or Triple Therapy With Warfarin, Aspirin, and Clopidogrel in Patients With Atrial Fibrillation. Arch Intern Med. 2010;170(16):1433-1441. In patients with AF, all combinations of warfarin, aspirin, and clopidogrel are associated with increased risk of nonfatal and fatal bleeding. Dual warfarin and clopidogrel therapy and triple therapy carried a more than 3-fold higher risk than did warfarin monotherapy. In patients with atrial fibrillation, adding multiple-drug therapy to prevent thromboembolism can greatly increase the risk for major bleeding, according to an *Archives of Internal Medicine* study. Investigators used Danish national databases to follow bleeding outcomes in some 80,000 patients with a discharge diagnosis of first-time atrial fibrillation. All patients had at least one postdischarge prescription for warfarin, aspirin, or clopidogrel. After a follow-up averaging 3.3 years, the relative risks associated with various regimens for fatal and nonfatal bleeding, relative to warfarin monotherapy, were as follows: Aspirin, 0.96 , Clopidogrel, 1.45, Clopidogrel + aspirin, 1.91, Warfarin + aspirin= 1.75, Warfarin + clopidogrel= 3.57, Warfarin + clopidogrel + aspirin= 4.03.

Liakopoulos OJ, Kuhn EW, Slottosch I, et al. **Preoperative statin** therapy for patients undergoing cardiac surgery. Cochrane Database Syst Rev. 2012 Apr 18;4:CD008493.
Preoperative statin therapy reduces the odds of post-operative AF and shortens the stay on the ICU and in the hospital. Statin pretreatment had no influence on perioperative mortality, stroke, myocardial infarction or renal failure. Since analysed studies included mainly patients undergoing myocardial revascularizations the results cannot be extrapolated to patients undergoing other cardiac procedures such as heart valve or aortic surgery.

Brain Natriuretic Peptide (BNP) has diagnostic value for both types of HF and is recommended where available, when diagnosis in unclear. The use of BNP in non-acute HF and community outpatient practice remains to be clarified.[3]

Table: Brain natriuretic peptide (BNP mainly secreted by ventricular myocardium**) & prohormone of BNP (NT-proBNP** longer half life, affected by renal fx**) assay cut-off points for the diagnosis of HF** [3]

	Age	HF unlikely	HF possible but consider alternative diagnoses	HF very likely
BNP (pg/mL)	**All**	**<100**	**100-500**	**>500**
NT-proBNP (pg/mL)	**<50**	**<300**	**300-450**	**>450**
	50-75	**<300**	**300-900**	**>900**
	>75	**<300**	**300-1800**	**>1800**

[11] Chen ZM, Pan HC, Chen YP, et al.; **COMMIT** (ClOpidogrel and Metoprolol in Myocardial Infarction Trial) collaborative group. Early intravenous then oral metoprolol in 45,852 patients with acute myocardial infarction: randomised placebo-controlled trial. Lancet. 2005 Nov 5;366(9497):1622-32. Second Chinese Cardiac Study COMMIT/CCS-2. Mean age 61, Fibrinolytic therapy 54%, Metoprolol 5mg IV over 2-3mins x 3 if HR & BP ok, then 15mins later 50mg po q6h Day 0-1, then 200mg controlled release od vs placebo x ~15days. ↓Reinfarction 2 vs 2.5%, ↓Ventricular fibrilation 2.5 vs 3 %, BUT ↑Cardiogenic shock 5 vs 3.9% (risk more with heart failure, systolic BP <120 & in the first 24hrs). INTERPRETATION: The use of early beta-blocker therapy in acute MI reduces the risks of reinfarction & ventricular fibrillation, but increases the risk of cardiogenic shock, esp. during the first day or so after admission. Consequently, it might generally be prudent to consider starting **beta-blocker therapy in hospital only when the haemodynamic condition after MI has stabilised**. (InfoPOEMs: The early use of metoprolol in patients with acute myocardial infarction who are also receiving thrombolytics and aspirin provides no short-term benefit compared with placebo. Since the early use, however, increases the risk of cardiogenic shock, it may be wise to delay starting metoprolol until the patient is hemodynamically stable. (LOE = 1b)).

[15] Shepherd J, Cobbe SM, Ford I, et al. Prevention of coronary heart disease with pravastatin in men with hypercholesterolemia (**WOSCOPS**). N Engl J Med 1995;333:1383-9. Ford I, Murray H, Packard CJ, Shepherd J, Macfarlane PW, Cobbe SM; West of Scotland Coronary Prevention Study Group. Long-term follow-up of the West of Scotland Coronary Prevention Study. (Woscops) N Engl J Med. 2007 Oct 11;357(15):1477-86. In the period approximately 10 years after completion of the trial, the risk of death from coronary heart disease or nonfatal myocardial infarction was 10.3% in the placebo group and 8.6% in the pravastatin group (P=0.02); over the entire follow-up period, the rate was 15.5% in the placebo group and 11.8% in the pravastatin group (P<0.001). In this analysis, 5 years of treatment
with pravastatin was associated with a significant reduction in coronary events for a subsequent 10 years in men with hypercholesterolemia who did not have a history of myocardial infarction.

(InfoPOEMs: Only statin lipid-lowering drugs have been shown to decrease overall mortality in patients with high cholesterol but without evidence of heart disease. However, most patients treated with one of these drugs will not benefit: 228 have to be treated for 3.3 years to prevent 1 additional death during this period. In pts with known heart dx, statins & fish oil both have been shown to decrease mortality. Niacin, resins, & diet have not been shown to decrease mortality. Fibrates (gemfibrozil & others) actually increase overall mortality & at the same time decrease cardiac mortality. (LOE =1a))

24. LaRosa JC. et al. Intensive Lipid Lowering with Atorvastatin in Patients with Stable Coronary Disease (**TNT**) . N Engl J Med. 2005 Mar 8;352 online. (InfoPOEMs: The benefit of intensive lipid therapy in patients with known heart disease is very modest: a number needed to treat (NNT) of 45 for 5 years to prevent any cardiovascular outcome. There was no difference in all-cause mortality between intensive and less intensive treatment groups (5.6% vs 5.7%), and the study was large enough and long enough to be able to detect such a benefit if one existed. Since the benefit of lipid lowering is greatest in patients with known disease, any benefit is certainly much less lower for patients without known disease who are at much lower risk. (LOE = 1b)) (**5461** of 15,464 pts in 8 wk open-label treatment with atorvastatin 10mg/d **were excluded**). McGowan MP; Treating to New Target (TNT) Study Group. There is no evidence for an increase in acute coronary syndromes after short-term abrupt discontinuation of statins in stable cardiac patients. Circulation. 2004 Oct 19;110(16):2333-5. Epub 2004 Oct 11. Shepherd J, et al. Effect of lowering LDL cholesterol substantially below currently recommended levels in patients with coronary heart disease and diabetes: the Treating to New Targets (TNT) study. Reduction of low-density lipoprotein cholesterol in patients with coronary heart disease and metabolic syndrome: analysis of the Treating to New Targets study. Lancet. 2006 Sep 9;368(9539):919-28. Wenger NK, Lewis SJ, Herrington DM, Bittner V, Welty FK; Treating to New Targets Study Steering Committee and Investigators. Outcomes of using high- or low-dose atorvastatin in patients 65 years of age or older with stable coronary heart disease. Ann Intern Med. 2007 Jul 3;147(1):1-9. The analysis suggests that additional clinical benefit can be achieved by treating older patients with CHD more aggressively to reduce low-density lipoprotein cholesterol levels to less than 2.6 mmol/L (<100 mg/dL). The findings support the use of intensive low-density lipoprotein cholesterol-lowering therapy in high-risk older persons with established cardiovascular disease. Larosa JC, Grundy SM, Kastelein JJ, Kostis JB, Greten H; Treating to New Targets (TNT) Steering Committee and Investigators. Safety and Efficacy of Atorvastatin-Induced Very Low-Density Lipoprotein Cholesterol Levels in Patients With Coronary Heart Disease (a Post Hoc Analysis of the Treating to New Targets [TNT] Study). Am J Cardiol. 2007 Sep 1;100(5):747-52. Epub 2007 Jun 14. In conclusion, the present analysis adds support to the concept that for patients with established atherosclerotic cardiovascular disease, a further risk reduction without sacrifice of safety can be achieved by reducing LDL cholesterol to very low levels. (Barter P, Gotto AM, LaRosa JC, Maroni J, et al; Treating to New Targets Investigators (TNT). HDL cholesterol, very low levels of LDL cholesterol, and cardiovascular events. N Engl J Med. 2007 Sep 27;357(13):1301-10. In this post hoc analysis, HDL was predictive of major cardiovascular events in patients treated with statins. This relationship was also observed among patients with LDL cholesterol levels below 70 mg per deciliter.) Wenger NK, Lewis SJ, Welty FK, Herrington DM, Bittner V. Beneficial effects of aggressive LDL cholesterol lowering in women with stable coronary heart disease in the Treating to New Targets (TNT) study. Heart. 2007 Dec 10; [Epub ahead of print] Conclusion Intensive lipid-lowering treatment with atorvastatin 80 mg produced significant reductions in relative risk for major cardiovascular events compared with atorvastatin 10 mg in both women and men with stable CHD.
Shepherd J, Kastelein JJ, et al.; TNT (Treating to New Targets) Investigators. Intensive lipid lowering with atorvastatin in patients with coronary heart disease and chronic kidney disease: the TNT (Treating to New Targets) study. J Am Coll Cardiol. 2008 Apr 15;51(15):1448-54. [PubMed - in process] Aggressive lipid lowering with atorvastatin 80 mg was both safe and effective in reducing the excess of cardiovascular events in a high-risk population with CKD and CHD.
Shepherd J, Kastelein JP, Bittner VA, Carmena R, Deedwania PC, Breazna A, Dobson S, Wilson DJ, Zuckerman AL, Wenger NK; Treating to New Targets Steering Committee and Investigators. Intensive lipid lowering with atorvastatin in patients with coronary artery disease, diabetes, and chronic kidney disease. Mayo Clin Proc. 2008 Aug;83(8):870-9. The absolute risk reduction in patients with diabetes and CKD was substantial, yielding a number needed to treat of 14 to prevent 1 major cardiovascular event over 4.8 years.
Patients with diabetes, stable coronary artery disease, and mild to moderate CKD experience marked reduction in cardiovascular events with intensive lipid lowering, in contrast to previous observations in patients with diabetes and end-stage renal disease.

JAMA.2005Nov16;294(19):2437-2445. (InfoPOEMs: The intensive reduction of low-density lipoprotein (LDL) levels to well below 100 mg/dL (2.5 mmol/L) did not result in a significant reduction in the recurrence of major coronary events or all-cause mortality among patients with stable coronary artery disease. Intensive lowering is associated with an increased risk of discontinuing medication because of adverse events and significant drug costs. Aiming for an LDL of approximately 100 mg/dL (2.5 mmol/L) seems optimal for the majority of patients with stable disease. (LOE = 1b-))
Tikkanen MJ, Holme I, Cater NB, et al.; Incremental DEcrease through Aggressive Lipid Lowering Investigators. Comparison of efficacy and safety of atorvastatin (80 mg) to simvastatin (20 to 40 mg) in patients aged <65 versus >or=65 years with coronary heart disease (from the Incremental DEcrease through Aggressive Lipid Lowering [IDEAL] study). Am J Cardiol. 2009 Mar 1;103(5):577-82. Epub 2009 Jan 17. Rates of any reported serious adverse event were higher in older patients, but did not differ between the 2 statin groups. In conclusion, except for any CV events in the older group, significant reductions in primary and secondary end points were observed only in patients <65 years of age. The safety of atorvastatin (80 mg) and simvastatin (20 to 40 mg) was similar in patients aged <65 and >65 years with stable coronary disease.

31. Keech A, Simes RJ, Barter P, et al. **FIELD** study investigators. Effects of long-term fenofibrate therapy on cardiovascular events in 9795 people with type 2 diabetes mellitus (the FIELD study): randomised controlled trial. Lancet. 2005 Nov 26;366(9500):1849-61. INTERPRETATION: Fenofibrate did not significantly reduce the risk of the primary outcome of coronary events. It did reduce total cardiovascular events, mainly due to fewer non-fatal myocardial infarctions and revascularisations. The higher rate of starting statin therapy in patients allocated placebo might have masked a moderately larger treatment benefit. (But some **non-significant** concerns with fenofibrate vs placebo such as: an ↑ in cardiac mortality 2.2 vs 1.9%, an ↑ in total CVD events for those with previous CVD 25.5 vs 25.1%, an excess in non-cardiovascular disease deaths 4.4 vs 4% & an ↑ in total mortality 7.3 vs 6.6%). But may benefit albuminuria & retinopthy. (InfoPOEMs: In this study, patients with type 2 diabetes treated with fenofibrate (Antara, Lofibra, Tricor) had no significant reduction in coronary events compared with patients treated with placebo. There was a small reduction, however, in nonfatal myocardial infarctions, total cardiovascular disease, and revascularization. (LOE = 1b)) Keech AC, Mitchell P, Summanen PA, et al, for the FIELD study investigators. Effect of fenofibrate on the need for laser treatment for diabetic retinopathy (FIELD study): a randomised controlled trial. Lancet 2007;370(9600):1687-1697. In patients with type 2 diabetes mellitus fenofibrate (Antara, Lofibra, Tricor) modestly reduces the number of laser treatments for retinopathy. (LOE = 1b)

N Engl J Med. 2006 Aug 10;355(6):549-59. (Kent DM. Stroke--an equal opportunity for the initiation of statin therapy. N Engl J Med. 2006 Aug 10;355(6):613-5.) Amarenco P, Goldstein LB, Szarek M, Sillesen H, Rudolph AE, Callahan A 3rd, Hennerici M, Simunovic L, Zivin JA, Welch KM; SPARCL Investigators. Effects of Intense Low-Density Lipoprotein Cholesterol Reduction in Patients With Stroke or Transient Ischemic Attack. The Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial. Stroke. 2007 Oct 25; [Epub ahead of print] As compared with having no change or an increase in LDL-C, achieving a >/=50% lowering was associated with a greater reduction in the risk of stroke and major coronary events with no increase in brain hemorrhages. Goldstein LB, Amarenco P, Szarek M, Callahan A 3rd, Hennerici M, Sillesen H, Zivin JA, Welch KM; On behalf of the SPARCL Investigators. Hemorrhagic stroke in the Stroke Prevention by Aggressive Reduction in Cholesterol Levels study. Neurology. 2007 Dec 12; [Epub ahead of print] Hemorrhagic stroke was more frequent in those treated with atorvastatin, in those with a hemorrhagic stroke as an entry event, in men, and increased with age. Those with Stage 2 hypertension at the last visit prior to the hemorrhagic stroke were also at increased risk. Treatment did not disproportionately affect the hemorrhagic stroke risk associated with these other factors. There were no relationships between hemorrhage risk and baseline low-density lipoprotein (LDL) cholesterol level or recent LDL cholesterol level in treated patients.
Sillesen H, Amarenco P, Hennerici MG, et al. on Behalf of the SPARCL Investigators. Atorvastatin Reduces the Risk of Cardiovascular Events in Patients With Carotid Atherosclerosis. A Secondary Analysis of the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial. Stroke. 2008 Oct 9. [Epub ahead of print] Consistent with the overall results of the SPARCL intention to treat population, intense lipid lowering with atorvastatin reduced the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis. The carotid stenosis group may have greater benefit.
Amarenco P, Benavente O, Goldstein LB, et al.; on behalf of the SPARCL Investigators. Results of the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial by Stroke Subtypes. Stroke. 2009 Feb 19. [Epub ahead of print] Atorvastatin 80 mg/d is similarly efficacious in preventing strokes and other cardiovascular events, irrespective of baseline ischemic stroke subtype.

Arch Intern Med. 2006 Nov 27;166(21):2307-13. Subjects taking statins for a mean of 4.3 years (n=42 848) had a lower incidence of heart attack, stroke, revascularization, and other events than controls. The authors estimate the following numbers needed to treat for 4.3 years: 60, to prevent one major coronary event; 268 for stroke; 61 for nonfatal myocardial infarction and 93 for revascularization. In patients without CV disease, statin therapy decreases the incidence of major coronary and cerebrovascular events and revascularizations but not coronary heart disease or overall mortality.

Statin treatment is an efficient lipid-lowering therapy in children with familial hypercholesterolemia. It seems to be safe in the short term but long-term safety is unknown. Children treated with statins should be carefully followed up by their pediatricians. Large long-term randomized controlled trials are needed to establish the long-term safety of statins.

77. Study of the Effectiveness of Additional Reductions in Cholesterol and Homocysteine (**SEARCH**) Collaborative Group. Intensive lowering of LDL cholesterol with 80 mg versus 20 mg simvastatin daily in 12 064 survivors of myocardial infarction: a double-blind randomised trial. The Lancet, Early Online Publication, 9 November 2010 doi:10.1016/S0140-6736(10)60310-8.
78. Cholesterol Treatment Trialists' (**CTT**) Collaboration. Efficacy and safety of more intensive lowering of LDL cholesterol: a meta-analysis of data from 170 000 participants in 26 randomised trials. The Lancet, Early Online Publication, 9 November 2010. doi:10.1016/S0140-6736(10)61350-5. In this analysis of patient data pooled from multiple studies, intensive statin therapy was more effective than less intensive statin therapy in reducing the rate of major cardiovascular events. Additionally, statins are more effective than controls in preventing major cardiovascular events. In spite of the authors' attempts to link these data to low-density lipoprotein (LDL) concentrations, none of the trials randomly assigned patients to specific LDL targets. (LOE = 1a) These authors pooled the patient-level data from 26 studies each involving at least 1000 patients and having at least 2 years of follow-up. Five of the trials compared intensive statin therapy with less intensive statin therapy and 21 compared statins with controls. Of the 5 trials comparing statin intensity, 2 evaluated 8659 patients with acute coronary syndromes (2.1 years of follow-up) and 3 evaluated 30,953 patients with stable coronary artery disease (5.8 years of follow-up). After 1 year of treatment, the LDL cholesterol levels decreased by an average 0.51 mmol/L (20 mg/dL). The annual rate of major vascular events cardiovascular death, nonfatal myocardial infarction, revascularization, or stroke) was 4.5% in the intensive therapy group and 5.3% in the less intense therapy group (number needed to treat [NNT] = 200 per year). Of the 14 trials comparing statin therapy with control (128,596 patients with 4.8 years of follow-up), 6 appear to be primary prevention studies and the remainder were for secondary prevention. In these 14 studies, after 1 year of treatment the LDL cholesterol levels decreased by 1.07 mmol/L (41 mg/dL). The annual rate of major vascular events was 2.8% in the patients taking statins compared with 3.6% in patients taking a control agent (NNT = 125 per year). Although they don't report the annual rate of death from any cause for each treatment group, the authors report the total death rate for the intensively treated patients plus the statin-treated patients (2.1%) compared with the rate of the less intensively treated patients plus control patients (2.3%). This works out to a number needed to treat of 500 per year. The authors also try to correlate the outcomes data with the LDL levels achieved by the various interventions. However, since none of the trials actually randomized patients to specific lipid targets, this information should be interpreted cautiously and is best used to generate hypotheses. If you subscribe to the lipid theory of atherogenesis, you will love this part of the study. If you subscribe to alternat

TOP

inflammation, plaque stability, and so forth) or are a methodologic purist, you will be annoyed by the authors' extrapolations.

90. National Institutes of Health. NIH stops clinical trial (**AIM-HIGH**) on combination cholesterol treatment [press release]. May 26, 2011. Available here. A trial of extended-release **niacin** (Niaspan, Abbott) given in addition to statin therapy in patients with a history of cardiovascular disease, high triglycerides, and low levels of HDL cholesterol has been halted prematurely, 18 months ahead of schedule, because niacin offered no additional benefits in this patient population. There was also a small, unexplained increase in ischemic stroke (1.6 vs 0.7%)in the high-dose, extended-release niacin group, in the Atherothrombosis Intervention in Metabolic Syndrome with Low HDL Cholesterol/High Triglyceride and Impact on Global Health Outcomes (AIM-HIGH) study, according to a statement from the **National Heart Lung and Blood Institute** (NHLBI), which sponsored it. N=3414, 32months. AIM-HIGH enrolled 3,414 participants in the US and Canada with a history of cardiovascular disease, low HDL cholesterol, and high triglycerides, who were all prescribed simvastatin and who were also randomized to either high-dose, extended-release niacin in gradually increasing doses up to 2000 mg per day (n=1718) or placebo (n=1696). Of the participants, 515 were given a second LDL-cholesterol-lowering drug, ezetimibe (Zetia, Merck/Schering-Plough), in order to maintain LDL-cholesterol levels at the target range between 40 and 80 mg/dL.

36. LaRosa JC. et al. Intensive Lipid Lowering with Atorvastatin in Patients with Stable Coronary Disease (**TNT**) . N Engl J Med. 2005 Mar 8;352 online. (InfoPOEMs: The benefit of intensive lipid therapy in patients with known heart disease is very modest: a number needed to treat (NNT) of 45 for 5 years to prevent any cardiovascular outcome. There was no difference in all-cause mortality between intensive and less intensive treatment groups (5.6% vs 5.7%), and the study was large enough and long enough to be able to detect such a benefit if one existed. Since the benefit of lipid lowering is greatest in patients with known disease, any benefit is certainly much less lower for patients without known disease who are at much lower risk. (LOE = 1b)) (**5461** of 15,464 pts in 8 wk open-label treatment with atorvastatin 10mg/d **were excluded**)
McGowan MP; Treating to New Target (TNT) Study Group. There is no evidence for an increase in acute coronary syndromes after short-term abrupt discontinuation of statins in stable cardiac patients. Circulation. 2004 Oct 19;110(16):2333-5. Epub 2004 Oct 11. Shepherd J, et al. Effect of lowering LDL cholesterol substantially below currently recommended levels in patients with coronary heart disease and **diabetes**: the Treating to New Targets (TNT) study. Diabetes Care. 2006 Jun;29(6):1220-6. (Deedwania P, et al. Treating to New Targets Investigators. Reduction of low-density lipoprotein cholesterol in patients with coronary heart disease and **metabolic syndrome**: analysis of the Treating to New Targets study. Lancet. 2006 Sep 9;368(9539):919-28.) Wenger NK, Lewis SJ, Herrington DM, Bittner V, Welty FK; Treating to New Targets Study Steering Committee and Investigators. Outcomes of using high- or low-dose atorvastatin in patients **65 years of age or older** with stable coronary heart disease. Ann Intern Med. 2007 Jul 3;147(1):1-9. The analysis suggests that additional clinical benefit can be achieved by treating older patients with CHD more aggressively to reduce low-density lipoprotein cholesterol levels to less than 2.6 mmol/L (<100 mg/dL). The findings support the use of intensive low-density lipoprotein cholesterol-lowering therapy in high-risk older persons with established cardiovascular disease. Larosa JC, Grundy SM, Kastelein JJ, Kostis JB, Greten H; Treating to New Targets (TNT) Steering Committee and Investigators. Safety and Efficacy of Atorvastatin-Induced Very Low-Density Lipoprotein Cholesterol Levels in Patients With Coronary Heart Disease (a Post Hoc Analysis of the Treating to New Targets [TNT] Study). Am J Cardiol. 2007 Sep 1;100(5):747-52. Epub 2007 Jun 14. In conclusion, the present analysis adds support to the concept that for patients with established atherosclerotic cardiovascular disease, a further risk reduction without sacrifice of safety can be achieved by reducing LDL cholesterol to very low levels. (Barter P, Gotto AM, LaRosa JC, et al; Treating to New Targets Investigators (TNT). **HDL cholesterol, very low levels of LDL cholesterol**, and cardiovascular events. N Engl J Med. 2007 Sep 27;357(13):1301-10. In this post hoc analysis, HDL was predictive of major cardiovascular events in patients treated with statins. This relationship was also observed among patients with LDL cholesterol levels below 70 mg per deciliter.)
Wenger NK, Lewis SJ, Welty FK, Herrington DM, Bittner V. Beneficial effects of aggressive LDL cholesterol lowering in **women** with stable coronary heart disease in the Treating to New Targets (TNT) study. Heart. 2007 Dec 10; [Epub ahead of print] Conclusion Intensive lipid-lowering treatment with atorvastatin 80 mg produced significant reductions in relative risk for major cardiovascular events compared with atorvastatin 10 mg in both women and men with stable CHD. Shepherd J, Kastelein JJ, et al.; TNT (Treating to New Targets) Investigators. Intensive lipid lowering with atorvastatin in patients with coronary heart disease and **chronic kidney disease**: the TNT (Treating to New Targets) study. J Am Coll Cardiol. 2008 Apr 15;51(15):1448-54. [PubMed - in process] Aggressive lipid lowering with atorvastatin 80 mg was both safe and effective in reducing the excess of cardiovascular events in a high-risk population with CKD and CHD.

Afilalo J, Duque G, Steele R, et al. Statins for secondary prevention in elderly patients. J Am Coll Cardiol. 2008;51:37-45. The posterior median estimate of the number needed to treat to save 1 life was 28 (95% CI 15 to 56).
CONCLUSIONS: Statins reduce all-cause mortality in elderly patients and the magnitude of this effect is substantially larger than had been previously estimated. (InfoPOEMs: Treating 28 elderly patients with coronary heart disease (CHD) for 5 years will prevent 1 of them from dying during that period. For every 38 people treated for 5 years, 1 nonfatal myocardial infarction will be prevented; for every 58 patients treated for 5 years, 1 stroke will be prevented. (LOE = 1a))

Afilalo J, Majdan AA, Eisenberg MJ. Intensive statin therapy in acute coronary syndromes and stable coronary heart disease: a comparative meta-analysis of randomised controlled trials. Heart 2007;93(8):914-921.
<http://www.ncbi.nlm.nih.gov/entrez/query.fcgi?cmd=Retrieve&db=PubMed&list_uids=1727734 9&dopt=Abstract> Intensive statin therapy will decrease overall mortality rates compared with lower doses in patients with a recent history of acute coronary syndrome (ACS) but not in patients with stable coronary heart disease. However, 80 patients must be treated to prevent 1 additional death over 2 years. Intensive treatment decreases overall hospital admissions for heart failure in both groups and decreases major cardiac events in pts with stable coronary heart disease, but, again, the results are not striking. (LOE = 1a)

Amend KL, Landon J, Thyagarajan V, Niemcryk S, McAfee A. Incidence of Hospitalized Rhabdomyolysis with Statin and Fibrate Use in an Insured US Population (October). Ann Pharmacother. 2011 Sep 13. The number needed to harm was lower for combination statin-gemfibrozil therapy (2753) compared with that for statin therapy alone (454,545).

AIM-HIGH: National Institutes of Health. NIH stops clinical trial on combination cholesterol treatment [press release]. May 26, 2011. Available here. A trial of extended-release niacin (Niaspan, Abbott) given in addition to statin therapy in patients with a history of cardiovascular disease, high triglycerides, and low levels of HDL cholesterol has been halted prematurely, 18 months ahead of schedule, because niacin offered no additional benefits in this patient population. There was also a small, unexplained increase in ischemic stroke (1.6 vs 0.7%)in the high-dose, extended-release niacin group, in the Atherothrombosis Intervention in Metabolic Syndrome with Low HDL Cholesterol/High Triglyceride and Impact on Global Health Outcomes (AIM-HIGH) study, according to a statement from the National Heart Lung and Blood Institute (NHLBI), which sponsored it. N=3414, 32months. AIM-HIGH enrolled 3,414 participants in the US and Canada with a history of cardiovascular disease, low HDL cholesterol, and high triglycerides, who were all prescribed simvastatin and who were also randomized to either high-dose, extended-release niacin in gradually increasing doses up to 2000 mg per day (n=1718) or placebo (n=1696). Of the participants, 515 were given a second LDL-cholesterol-lowering drug, ezetimibe (Zetia, Merck/Schering-Plough), in order to maintain LDL-cholesterol levels at the target range between 40 and 80 mg/dL.

Amarenco P, et al.; Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Investigators. High-dose atorvastatin after stroke or transient ischemic attack. N Engl J Med. 2006 Aug 10;355(6):549-59. (Kent DM. Stroke--an equal opportunity for the initiation of statin therapy. N Engl J Med. 2006 Aug 10;355(6):613-5.) (InfoPOEMs: High-dose atorvastatin reduces the risk of recurrent stroke, but does not improve mortality rates. A reduction in the risk of transient ischemic attack (TIA) or unclassified stroke was partially offset by an increase in the risk of hemorrhagic stroke. (LOE = 1b)) Amarenco P, Goldstein LB, Szarek M, Sillesen H, Rudolph AE, Callahan A 3rd, Hennerici M, Simunovic L, Zivin JA, Welch KM; SPARCL Investigators. Effects of Intense Low-Density Lipoprotein Cholesterol Reduction in Patients With Stroke or Transient Ischemic Attack. The Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) Trial. Stroke. 2007 Oct 25; [Epub ahead of print] As compared with having no change or an increase in LDL-C, achieving a >/=50% lowering was associated with a greater reduction in the risk of stroke and major coronary events with no increase in brain hemorrhages. Goldstein LB, Amarenco P, Szarek M, Callahan A 3rd, Hennerici M, Sillesen H, Zivin JA, Welch KM; On behalf of the SPARCL Investigators. Hemorrhagic stroke in the Stroke Prevention by Aggressive Reduction in Cholesterol Levels study. Neurology. 2007 Dec 12; [Epub ahead of print] Hemorrhagic stroke was more frequent in those treated with atorvastatin, in those with a hemorrhagic stroke as an entry event, in men, and increased with age. Those with Stage 2 hypertension at the last visit prior to the hemorrhagic stroke were also at increased risk. Treatment did not disproportionately affect the hemorrhagic stroke risk associated with these other factors. There were no relationships between hemorrhage risk and baseline low-density lipoprotein (LDL) cholesterol level or recent LDL cholesterol level in treated patients.

BMJ. 2006 Apr 3; [Epub ahead of print] In Primary prevention trials the major coronary event rates vs placebo were in diabetics 10 → 8% (not significant) & non-diabetics 8→ 6%. In Secondary prevention trials the major coronary event rates vs placebo: in diabetics 34 → 27% & non-diabetics 22 → 17%.
Cowell SJ, Newby DE, Prescott RJ, et al.; Scottish Aortic Stenosis and Lipid Lowering Trial, Impact on Regression (SALTIRE) Investigators. A randomized trial of intensive lipid-lowering therapy in calcific aortic stenosis. N Engl J Med. 2005 Jun 9;352(23):2389-97. CONCLUSIONS: Intensive lipid-lowering therapy does not halt the progression of calcific aortic stenosis or induce its regression. This study cannot exclude a small reduction in the rate of disease progression or a significant reduction in major clinical end points. Long-term, large-scale, randomized, controlled trials are needed to establish the role of statin therapy in patients with calcific aortic stenosis.

Crouse JR 3rd, Raichlen JS, Riley WA, et al. Effect of Rosuvastatin 40mg od on Progression of Carotid Intima-Media Thickness in Low-Risk Individuals (n=984; Ros=702, placebo=282 over 2 years) With Subclinical Atherosclerosis: The METEOR Trial . JAMA. 2007 Mar 25; [Epub ahead of print] Rosuvastatin treatment was associated with a 49% reduction in LDL-C level, a 34% reduction in total cholesterol level, an 8% increase in HDL-C level, and a 16% reduction in level of triglycerides. Serious adverse cardiovascular events were infrequent (6 participants [0.86%] had 8 events [1.1%] in the rosuvastatin group vs 0% in the placebo group) In middle-aged adults with an FRS of less than 10% and evidence of subclinical atherosclerosis, rosuvastatin resulted in statistically significant reductions in the rate of progression of maximum CIMT over 2 years vs placebo. Rosuvastatin did not induce disease regression.

Fayad ZA, Mani V, Woodward M, et al, for the dal-PLAQUE Investigators. Safety and effi cacy of dalcetrapib on atherosclerotic disease using novel non-invasive multimodality imaging (dal-PLAQUE): a randomised clinical trial. Lancet 2011; online Sept 12.

FDA Mar/10 notified healthcare professionals and patients that, based on review of data from a large clinical trial and other sources, there is an increased risk of muscle injury in patients taking the highest approved dose of the cholesterol-lowering medication, Zocor (simvastatin) 80 mg, compared to patients taking lower doses of simvastatin and possibly other drugs in the "statin" class. Reviewing preliminary data from one clinical trial, the agency found that muscle injury, including rhabdomyolysis, was more common among patients on the 80-mg dose of simvastatin versus a 20-mg dose (0.9% vs. 0.02%). In addition, 11 (0.02%) of the patients in the simvastatin-80-mg group developed rhabdomyolysis compared with no patients in the simvastatin-20-mg group.

FDA June/11: Food and Drug Administration drug safety communication: New restrictions, contraindications, and dose limitations for Zocor (simvastatin) to reduce the risk of muscle injury. June 8, 2011. Limit using the 80-mg dose unless the patient has already been taking the drug for 12 months and there is no evidence of myopathy.

FDA Nov/11 notified healthcare professionals the cholesterol-lowering medicine Trilipix (fenofibric acid) may not lower a patient's risk of having a heart attack or stroke.

FDA Feb/12 has approved important safety label changes for the class of cholesterol-lowering drugs known as statins. The changes include removal of routine monitoring of liver enzymes from drug labels. Information about the potential for generally non-serious and reversible cognitive side effects and reports of increased blood sugar and glycosylated hemoglobin (HbA1c) levels has been added to the statin labels. The lovastatin label has been extensively updated with new contraindications and dose limitations when it is taken with certain medicines that can increase the risk for muscle injury.

FDA Mar/12 notified healthcare professionals of updates to the prescribing information concerning interactions between protease inhibitors (HIV & HCV) and certain statin drugs. Protease inhibitors and statins taken together may raise the blood levels of statins and increase the risk for muscle injury (myopathy/ rhabdomyolysis).

Fellström BC, Jardine AG, Schmieder RE, et al. the AURORA Study Group. Rosuvastatin and Cardiovascular Events in Patients Undergoing Hemodialysis. N Engl J Med. 2009 Mar 30. [Epub ahead of print] In patients undergoing hemodialysis, the initiation of treatment with rosuvastatin lowered the LDL cholesterol level but had no significant effect on the composite primary end point of death from cardiovascular causes, nonfatal myocardial infarction, or nonfatal stroke.

Ferrer-Garcia JC, et al. Alternate-day dosing of atorvastatin: effects in treating type 2 diabetic patients with dyslipidaemia. Acta Diabetol. 2006 Nov;43(3):75-8. LDL-C decreased 39% after the every-day period & 23% after the alternate-day atorvastatin dosing period (p<0.05). The target LDL-C concentration of <100 mg/dl was maintained in 19 patients (57.6%) in the alternate-day period. None of the 33 patients showed elevations in liver enzymes or creatine kinase during the alternate-day dosing period. Alternate-day dosing of atorvastatin could be an effective and safe alternative to daily-dosing in some type 2 diabetic patients.

Fleg JL, Mete M, Howard BV, et al. Effect of statins alone versus statins plus ezetimibe on carotid atherosclerosis in type 2 diabetes: the SANDS (Stop Atherosclerosis in Native Diabetics Study) trial. J Am Coll Cardiol. 2008 Dec 16;52(25):2198-205. Reducing LDL-C to aggressive targets resulted in similar regression of CIMT in patients who attained equivalent LDL-C reductions from a statin alone or statin plus ezetimibe. Common carotid artery IMT increased in those achieving standard targets.

Kapoor AS, et al. Strength of evidence for perioperative use of statins to reduce cardiovascular risk: systematic review of controlled studies. BMJ. 2006 Nov 6; [Epub ahead of print] The evidence base for routine administration of statins to reduce perioperative cardiovascular risk is inadequate.

Kastelein JJ, Akdim F, Stroes ES, et al. Simvastatin with or without ezetimibe in familial hypercholesterolemia. (ENHANCE trial) N Engl J Med 2008; 358:1431-1443. In patients with familial hypercholesterolemia, combined therapy with ezetimibe and simvastatin did not result in a significant difference in changes in intima-media thickness, as compared with simvastatin alone, despite decreases in levels of LDL cholesterol and C-reactive protein.

Keech A, Simes RJ, Barter P, et al. FIELD study investigators. Effects of long-term fenofibrate therapy on cardiovascular events in 9795 people with type 2 diabetes mellitus (the FIELD study): randomised controlled trial. Lancet. 2005 Nov 26;366(9500):1849-61. INTERPRETATION: Fenofibrate did not significantly reduce the risk of the primary outcome of coronary events. It did reduce total cardiovascular events, mainly due to fewer non-fatal myocardial infarctions and revascularisations. The higher rate of starting statin therapy in patients allocated placebo might have masked a moderately larger treatment benefit. (But some non-significant concerns with fenofibrate vs placebo such as: an ↑ in cardiac mortality 2.2 vs 1.9%, an ↑ in total CVD events for those with previous CVD 25.5 vs 25.1%, an excess in non-cardiovascular disease deaths 4.4 vs 4% & an ↑ in total mortality 7.3 vs 6.6%). But may benefit albuminuria & retinopthy. (InfoPOEMs: In this study, patients with type 2 diabetes treated with fenofibrate (Antara, Lofibra, Tricor) had no significant reduction in coronary events compared with patients treated with placebo. There was a small reduction, however, in nonfatal myocardial infarctions, total cardiovascular disease, and revascularization. (LOE = 1b)) Keech AC, Mitchell P, Summanen PA, et al, for the FIELD study investigators. Effect of fenofibrate on the need for laser treatment for diabetic retinopathy (FIELD study): a randomised controlled trial. Lancet 2007;370(9600):1687-1697. In patients with type 2 diabetes mellitus fenofibrate (Antara, Lofibra, Tricor) modestly reduces the number of laser treatments for retinopathy. (LOE = 1b) Scott R, O'Brien R, Fulcher G, Pardy C, d'Emden M, Tse D, Taskinen MR, Ehnholm C, Keech A; on behalf of the FIELD Study Investigators. The effects of fenofibrate treatment on cardiovascular disease risk in 9795 people with type 2 diabetes and various components of the metabolic syndrome: the FIELD study. Diabetes Care. 2008 Nov 4. [Epub ahead of print] MS components identify higher CVD risk in people with type 2 diabetes, so the absolute benefits of fenofibrate is likely to be greater when MS features are present. The highest risk and greatest benefits of fenofibrate are seen among those with marked hypertriglyceridemia.

Hiukka A, Westerbacka J, Leinonen ES, et al. Long-term effects of fenofibrate on carotid intima-media thickness and augmentation index in subjects with type 2 diabetes mellitus. (Field) J Am Coll Cardiol. 2008 Dec 16;52(25):2190-7. Fenofibrate treatment was not associated with beneficial changes in IMT, augmentation index, or biomarkers of inflammation and endothelial function.

Khoury J, et al. Effect of a cholesterol-lowering diet on maternal, cord, and neonatal lipids, and pregnancy outcome: a randomized clinical trial. Am J Obstet Gynecol. 2005 Oct;193(4):1292-301. (InfoPOEMs: In this study of low-risk pregnant women, a diet rich in fish and low in other animal fats resulted in a marked decrease in the number of preterm births. These results seem too good to be true and further confirmatory evidence is needed. In the meantime, as long as the fish are free of toxins the potential benefit may be large and there is no apparent risk. (LOE = 1b))

Kjekshus J, Apetrei E, Barrios V, et al. the CORONA Group. Rosuvastatin in Older Patients with Systolic Heart Failure. N Engl J Med. 2007 Nov 5; [Epub ahead of print] Rosuvastatin did not reduce the primary outcome or the number of deaths from any cause in older patients with systolic heart failure, although the drug did reduce the number of cardiovascular hospitalizations. The drug did not cause safety problems. (Cleland JGF, McMurray JJV, Kjekshus J, et al. Plasma concentration of amino-terminal pro-brain natriuretic peptide in chronic heart failure: prediction of cardiovascular events and interaction with the effects of rosuvastatin: a report from CORONA (Controlled Rosuvastatin Multinational Trial in Heart Failure). J Am Coll Cardiol 2009; 54:1850-1859.)

Klein BE, et al. Statin use and incident nuclear cataract. JAMA. 2006 Jun 21;295(23):2752-8. (InfoPOEMs: Statin use is associated with a reduced incidence of nuclear cataracts, the most common type of age-related cataracts. However, this type of study design (prospective cohort study) does not prove a causal relationship between the use of statins and lower risk of developing cataracts. It is possible that other confounding variables (eg, genetics or patient compliance) are causally related. (LOE = 2b)) (Tan JS, Mitchell P, Rochtchina E, Wang JJ. Statin use and the long-term risk of incident cataract: the Blue Mountains Eye Study. Am J Ophthalmol. 2007 Apr;143(4):687-9. Epub 2006 Dec 20. Statin use was found to reduce by 50% the risk of cataract development, principally nuclear or cortical cataract subtypes.)

Law M, Rudnicka AR. Statin safety: a systematic review. Am J Cardiol. 2006 Apr 17;97(8A):52C-60C. Epub 2006 Feb 3.For statins other than cerivastatin, the incidence of rhabdomyolysis in 2 cohort studies was 3.4 (1.6 to 6.5) per 100,000 person-years, an estimate supported by data from 20 randomized controlled trials. Case fatality was 10%. Incidence was about 10 times greater when gemfibrozil was used in combination with statins. Incidence was higher (4.2 per 100,000 person-years) with lovastatin, simvastatin, or atorvastatin (which are oxidized by cytochrome P450 3A4 [CYP3A4], which is inhibited by many drugs) than pravastatin or fluvastatin (which are not oxidized by CYP3A4). In persons taking simvastatin, lovastatin, or atorvastatin, 60% of cases involved drugs known to inhibit CYP3A4 (especially erythromycin and azole antifungals), and 19% involved fibrates, principally gemfibrozil. The incidence of myopathy in patients treated with statins, estimated from cohort studies supported by randomized trials, was 11 per 100,000 person-years. For liver disease, randomized trials reported fewer hepatobiliary disorders in patients allocated statins than in those allocated placebo. The notification rate of liver failure to regulatory authorities was about 1 per million person-years of statin use. Randomized trials show no excess of renal disease or proteinuria in statin-allocated participants, and the decline in glomerular filtration rate was smaller with statins than with placebo. Evidence from 4 cohort studies and case reports suggests that statins cause peripheral neuropathy, but the attributable risk is small (12 per 100,000 person-years). No change in cognitive function was found in randomized trials of statins in elderly patients.

JAMA. 2005 Nov 16;294(19):2437-2445. (InfoPOEMs: The intensive reduction of low-density lipoprotein (LDL) levels to well below 100 mg/dL (2.5 mmol/L) did not result in a significant reduction in the recurrence of major coronary events or all-cause mortality among patients with stable coronary artery disease. Intensive lowering is associated with an increased risk of discontinuing medication because of adverse events and significant drug costs. Aiming for an LDL of approximately 100 mg/dL (2.5 mmol/L) seems optimal for the majority of patients with stable disease. (LOE = 1b-))

Pignone M, Aspirin, statins, or both drugs for the primary prevention of coronary heart disease events in men: a cost-utility analysis. Ann Intern Med. 2006 Mar 7;144(5):326-36. Summary for patients in: Ann Intern Med. 2006 Mar 7;144(5):I29. (InfoPOEMs: From the viewpoint of cost to a third-party payer, the costs of aspirin alone are reasonable in men at low-risk for coronary heart disease (CHD); the addition of a statin to aspirin therapy in these men is above what is considered to be reasonable cost for prevention. However, the combination of aspirin and a statin is cost-effective when men are at high risk (10% or above). (LOE = 2a))
PILL Collaborative Group (2011) An International Randomised Placebo-Controlled Trial of a Four-Component Combination Pill ("Polypill") in People with Raised Cardiovascular Risk. PLoS ONE 6(5): e19857. doi:10.1371/journal.pone.0019857.
Pfizer April/08 In a study in patients with mild-to-moderate Alzheimer's disease (AD), the addition of Lipitor (atorvastatin calcium tablets) 80 mg to Aricept® (donepezil HCl) 10 mg showed no significant differences in cognition or global function (key measures of Alzheimer's progression) compared to placebo plus Aricept 10 mg. Furthermore, no statistically significant differences were seen on various cognitive, behavioral and functional secondary endpoints. However, the Lipitor arm was not associated with greater cognitive decline than the placebo arm in this trial. The results were presented today at the annual American Academy of Neurology meeting in Chicago. The 18-month study, called Lipitor's Effect on Alzheimer's Dementia (LEADe), included 640 patients and is the largest statin study in Alzheimer's disease.

Taylor F, Ward K, Moore THM, Burke M, Davey Smith G, Casas JP, Ebrahim S. Statins for the primary prevention of cardiovascular disease. Cochrane Database of Systematic Reviews 2011, Issue 1. Art. No.: CD004816. DOI: 10.1002/14651858.CD004816.pub4. Although reductions in all-cause mortality, composite endpoints and revascularisations were found with no excess of adverse events, there was evidence of selective reporting of outcomes, failure to report adverse events and incl with cardiovascular disease. Only limited evidence showed that primary prevention with statins may be cost effective and improve patient quality of life. Caution should be taken in prescribing statins for primary prevention among people at low cardiovascular risk.

Thavendiranathan P, Bagai A, Brookhart MA, Choudhry NK. Primary Prevention of Cardiovascular Diseases With Statin Therapy: A Meta-analysis of Randomized Controlled Trials. Arch Intern Med. 2006 Nov 27;166(21):2307-13. Subjects taking statins for a mean of 4.3 years (n=42 848) had a lower incidence of heart attack, stroke, revascularization, and other events than controls. The authors estimate the following numbers needed to treat for 4.3 years: 60, to prevent one major coronary event; 268 for stroke; 61 for nonfatal myocardial infarction and 93 for revascularization. In patients without CV disease, statin therapy decreases the incidence of major coronary and cerebrovascular events and revascularizations but not coronary heart disease or overall mortality.
Tirosh A, Rudich A, Shochat T, et al. Changes in triglyceride levels and risk for coronary heart disease in young men. Ann Intern Med. 2007 Sep 18;147(6):377-85. Summary for patients in: Ann Intern Med. 2007 Sep 18;147(6):I45. Two triglyceride measurements obtained 5 years apart may assist in assessing CHD risk in young men. A decrease in initially elevated triglyceride levels is associated with a decrease in CHD risk compared with stable high triglyceride levels. However, this risk remains higher than in those with persistently low triglyceride levels.

Versmissen J, Oosterveer DM, Yazdanpanah M, et al. Efficacy of statins in familial hypercholesterolaemia: a long term cohort (8.5yr) study. BMJ. 2008 Nov 11;337:a2423. doi: 10.1136/bmj.a2423. In January 1990, 413 (21%) of the patients had started statin treatment, and during follow-up another 1294 patients (66%) started after a mean delay of 4.3 years. Most patients received simvastatin (n=1167, 33 mg daily) or atorvastatin (n=211, 49 mg daily). Lower statin doses than those currently advised reduced the risk of coronary heart disease to a greater extent than anticipated in patients with familial hypercholesterolaemia. With statin treatment, such patients no longer have a risk of myocardial infarction significantly different from that of the general population.

Vuorio A, Kuoppala J, Kovanen PT, Humphries SE, et al. Statins for children with familial hypercholesterolemia. Cochrane Database of Systematic Reviews 2010, Issue 7. Art. No.: CD006401. Statin treatment is an efficient lipid-lowering therapy in children with familial hypercholesterolemia. It seems to be safe in the short term but long-term safety is unknown. Children treated with statins should be carefully followed up by their pediatricians. Large long-term randomized controlled trials are needed to establish the long-term safety of statins.

Early intravenous then oral metoprolol in 45,852 patients with acute myocardial infarction: randomised placebo-controlled trial. Lancet. 2005 Nov 5;366(9497):1622-32. Second Chinese Cardiac Study COMMIT/CCS-2. Mean age 61, Fibrinolytic therapy 54%, Metoprolol 5mg IV over 2-3mins x 3 if HR & BP ok, then 15mins later 50mg po q6h Day 0-1, then 200mg controlled release od vs placebo x ~15days. ↓Reinfarction 2 vs 2.5%, ↓Ventricular fibrilation 2.5 vs 3 %, BUT ↑Cardiogenic shock 5 vs 3.9% (risk more with heart failure, systolic BP <120 & in the first 24hrs). INTERPRETATION: The use of early beta-blocker therapy in acute MI reduces the risks of reinfarction & ventricular fibrillation, but increases the risk of cardiogenic shock, esp. during the first day or so after admission. Consequently, it might generally be prudent to consider starting **beta-blocker therapy in hospital only when the haemodynamic condition after MI has stabilised**. (InfoPOEMs: The early use of metoprolol in patients with acute myocardial infarction who are also receiving thrombolytics and aspirin provides no short-term benefit compared with placebo. Since the early use, however, increases the risk of cardiogenic shock, it may be wise to delay starting metoprolol until the patient is hemodynamically stable. (LOE = 1b)).

Benefit of clopidogrel in patients with acute coronary syndromes without ST-segment elevation in various risk groups. Circulation. 2002 Sep 24;106(13):1622-6.)

[52] CAPRIE Steering Committee. A randomized, blinded trial of clopidogrel vs aspirin in patients at risk of ischemic events (CAPRIE). Lancet 1996; 348:1329-39.

[53] Sabatine MS, et al. Addition of Clopidogrel to Aspirin and Fibrinolytic Therapy for Myocardial Infarction with ST-Segment Elevation (CLARITY-TIMI 28). N Engl J Med. 2005 Mar 9; [Epub] (N=3491,Groups: Plavix 300mg x1 then 75mg od (median **4 doses** given) until angiography vs placebo had 30 day mortality of less than 5%, age <75yr Mean age 57, >2/3 of pts fibrin specific lytic, excluded high bleeding risk pts (1.9 vs 1.7% major bleeds), few CABG performed, thus select pts were studied, mechanism may be to prevent reocclusion) (InfoPOEMs: Adding clopidogrel to aspirin and fibrinolytic therapy during the first week in patients with ST- segment elevation myocardial infarction reduces the likelihood of recurrent myocardial infarction and ischemia leading to revascularization over a 30-day period (number needed to treat = 15). The short-term risk of major bleeding was low. This trial does not address how long patients should continue to take clopidogrel after the first week of treatment. (LOE = 1b)) (Sabatine MS, Cannon CP, Gibson CM, et al.; Clopidogrel as Adjunctive Reperfusion Therapy (CLARITY)-Thrombolysis in Myocardial Infarction (TIMI) 28 Investigators. Effect of clopidogrel pretreatment before percutaneous coronary intervention in patients with ST-elevation myocardial infarction treated with fibrinolytics: the **PCI-CLARITY** study. JAMA. 2005 Sep 14;294(10):1224-32. CONCLUSIONS: Clopidogrel pretreatment significantly reduces the incidence of cardiovascular death or ischemic complications both before and after PCI and without a significant increase in major or minor bleeding. These data add further support to the early use of clopidogrel in STEMI and the strategy of routine clopidogrel pretreatment in patients undergoing PCI).

[54] Chen ZM, Jiang LX, Chen YP, et al. COMMIT (ClOpidogrel and Metoprolol in Myocardial Infarction Trial) collaborative group. Addition of clopidogrel to aspirin in 45,852 patients with acute myocardial infarction: randomised placebo-controlled trial. Lancet. 2005 Nov 5;366(9497):1607-21. COMMIT/CCS-2 trial (Mean age 61, n=45,852, <24hr since MI symptom onset, primary PCI or high risk bleeding were excluded, 54% rec'd thrombolysis (primarily non fibrin specific: urokinase) , & <5% went on to have angiography, Plavix 75mg od (no loading dose) + ASA162mg od vs ASA 162mg od for a **mean of 15 days**, Death/MI/stroke 9.2 vs 10.1%, Death 7.5 vs 8.1%, Major Bleeding both equal ~0.6%, Minor bleeds 3.6 vs 3.1%). INTERPRETATION: In a wide range of patients with acute MI, adding clopidogrel 75 mg daily to aspirin and other standard treatments (such as fibrinolytic therapy) safely reduces mortality and major vascular events in hospital, and should be considered routinely.

Circulation. 2006 Apr 25;113(16):1950-7. Epub 2006 Apr 17. Current use of etoricoxib was associated with a 2.09-fold (95% confidence interval [CI], 1.10 to 3.97) risk of AMI compared with no use of NSAIDs during the prior year. Current use of rofecoxib (RR=1.29; 95% CI, 1.02 to 1.63), celecoxib (RR=1.56; 95% CI, 1.22 to 2.00), and diclofenac (RR=1.37; 95% CI, 1.17 to 1.59) also significantly increased the AMI risk. For current use of valdecoxib, the RR was 4.60 (95% CI, 0.61 to 34.51). RRs appeared to increase with higher daily doses of COX-2 inhibitors and were also increased in patients without major cardiovascular risk factors.

Antman EM, et al. Enoxaparin versus Unfractionated Heparin with Fibrinolysis for ST-Elevation Myocardial Infarction. (EXTRACT-TIMI 25)N Engl J Med. 2006 Mar 20; [Epub ahead of print] Conclusions In patients receiving fibrinolysis for ST-elevation myocardial infarction, treatment with enoxaparin throughout the index hospitalization is superior to treatment with unfractionated heparin for 48 hours but is associated with an increase in major bleeding episodes. (InfoPOEMs: For every 1000 patients treated with enoxaparin instead of unfractionated heparin there were 15 fewer nonfatal myocardial infarctions (MIs), 7 fewer urgent revascularizations, and 6 fewer deaths, but there were 4 additional episodes of nonfatal major bleeding. Boden WE, O'rourke RA, Teo KK, Hartigan PM, et al. Optimal Medical Therapy with or without PCI for Stable Coronary Disease. COURAGE Trial Research Group. N Engl J Med. 2007 Mar 26; [Epub ahead of print] As an initial management strategy in patients with stable coronary artery disease, PCI did not reduce the risk of death, myocardial infarction, or other major cardiovascular events when added to optimal medical therapy. PCI does not lower the rates of myocardial infarction or death in patients with stable coronary artery disease who receive optimal medical treatment, a large trial concluded. The study, released early online by NEJM, randomized nearly 2300 patients either to PCI with optimal medical therapy (intensive pharmacologic treatment plus lifestyle intervention) or to optimal medical therapy alone. After a median follow-up of almost 5 years, 19% in the PCI group died or had MIs, compared with 18.5% who received medical therapy alone. PCI patients were more likely to be free of angina after 1 and 3 years, but there was no significant difference after 5 years. One-third of patients in the medical therapy group ultimately required revascularization, while 21% in the PCI group needed additional revascularization. An editorialist concludes: "Patients whose condition is clinically unstable, who have left main coronary artery disease, or in whom medical therapy has failed to control symptoms remain candidates for revascularization, but PCI should not play a major role as part of a secondary prevention strategy."

Bonnefoy E, Steg PG, Boutitie F, et al. Comparison of primary angioplasty and pre-hospital fibrinolysis in acute myocardial infarction (CAPTIM) trial: a 5-year follow-up. Eur Heart J. 2009 Jul;30(13):1598-606. Epub 2009 May 8. The 5-year follow-up is consistent with the 30-day outcomes of the trial, showing similar mortality for primary percutaneous coronary intervention and a policy of pre-hospital lysis followed by transfer to an interventional center. In addition, for patients treated within 2 h of symptom onset, 5-year mortality was lower with pre-hospital lysis.

Long term survival after evidence based treatment of acute myocardial infarction and revascularisation: follow-up of population based Perth MONICA cohort, 1984-2005. BMJ. 2009 Jan 26;338:b36. doi: 10.1136/bmj.b36. The improving trends in 12 year survival after a definite acute myocardial infarction are associated with progressive use of evidence based treatments during the initial admission to hospital and in the 12 months after the event. These changes in the management of acute myocardial infarction are probably contributing to the continuing decline in mortality from coronary heart disease in Australia.

DAD study group. Class of antiretroviral drugs and the risk of myocardial infarction. N Engl J Med 2007; 356: 1723-1735. Increased exposure to protease inhibitors is associated with an increased risk of myocardial infarction, which is partly explained by dyslipidemia. We found no evidence of such an association for nonnucleoside reverse-transcriptase inhibitors; however, the number of person-years of observation for exposure to this class of drug was less than that for exposure to protease inhibitors. (23,437 pts followed for a median of 4.5yrs, there were 345 MIs).

Hannan EL, Racz MJ, Walford G, et al. Long-term outcomes of coronary-artery bypass grafting versus stent implantation. N Engl J Med 2005; 352: 2174-83. (InfoPOEMs: Coronary artery bypass grafting (CABG) is associated with lower long-term mortality than percutaneous coronary interventions (PCI) with stenting for most anatomic groups in patients with multivessel disease, and a lower risk of requiring revascularization in the 3 years following intervention. Of course, this was an observational study and the groups were quite different at baseline, so we must be cautious about drawing firm treatment conclusions, even with appropriate statistical adjustments. Stenting is less invasive and is associated with lower unadjusted in-hospital mortality, so it remains a good option for many patients. (LOE = 2b))

Koek HL, et al. Short- and long-term prognosis after acute myocardial infarction in men versus women. Am J Cardiol. 2006 Oct 15;98(8):993-9. Epub 2006 Aug 17. In conclusion, our findings in an unselected cohort (n=21,565) covering a complete nation indicate that the worse short- and long-term prognoses after an AMI in women compared with men may largely be explained by differences in age, whereas differences in co-morbidity, origin, infarct location, and reperfusion therapy seem to contribute little.

León H, Shibata MC, Dorgan M, et al. Effect of fish oil on arrhythmias and mortality: systematic review. BMJ 2008; DOI: 10.1136/bmj.a2931. Fish oil supplementation was associated with a significant reduction in deaths from cardiac causes but had no effect on arrhythmias or all cause mortality. Evidence to recommend an optimal formulation of EPA or DHA to reduce these outcomes is insufficient. Fish oils are a heterogeneous product, and the optimal formulations for DHA and EPA remain unclear.

Levesque LE, Brophy JM, Zhang B. Time variations in the risk of myocardial infarction among elderly users of COX-2 inhibitors. CMAJ. 2006 May 23;174(11):1563-9. Epub 2006 May 2. A small proportion of patients using rofecoxib for the first time had their first MI shortly after starting the drug. This risk did not increase with the length of treatment and returned to baseline shortly after treatment was discontinued. More research is needed to identify those most susceptible to cardiotoxicity mediated by COX-2 inhibitor therapy.

Two risk factors identified: advanced gestational age & serum potassium at the upper limit of normal.

Ehret GB, et al. Drug-Induced Long QT **Syndrome** in Injection Drug Users Receiving **Methadone**: High Frequency in Hospitalized Patients and Risk Factors. Arch Intern Med. 2006 Jun 26;166(12):1280-7.

FDA Feb/10 notified healthcare professionals and patients that it is reviewing clinical trial data about a potentially serious effect on the heart from the use of Invirase (saquinavir) in combination with Norvir (ritonavir), antiviral medications given together to treat HIV infection. The data suggest that together the two drugs may affect the electrical activity of the heart, known as prolonged QT or PR intervals.

FDA Nov/10 is requesting that manufacturers of the painkiller **propoxyphene** pull the drug from the market because of concerns over cardiotoxicity. (Propoxyphene is marketed alone as Darvon & combined with acetaminophen as Darvocet.) The agency's request is based on data showing that, even when taken at therapeutic doses, the drug can lead to potentially dangerous changes in the heart's electrical activity, including prolonged PR & QT intervals & widened QRS complex. FDA advises clinicians to stop prescribing propoxyphene and to ask current users to discontinue the drug. FDA's MedWatch alert

FDA Dec/10 The injectable form of dolasetron mesylate (Anzemet) should not be used to prevent nausea or vomiting related to chemotherapy because the drug increases the risk for torsade de pointes, the FDA announced on Friday. The FDA recommends against using Anzemet injections in patients with congenital long-QT syndrome. The warning does not apply to Anzemet tablets because the risks for developing an abnormal heart rhythm are not as high as with the injections. FDA MedWatch alert (Free)

FDA July/11 FDA has added a warning to the label of the atypical antipsychotic quetiapine (Seroquel) cautioning about potential increases in the QT interval. Postmarketing cases of QT prolongation have been reported in some 17 patients, according to the *New York Times.* These patients had overdosed on quetiapine, had other illnesses, or were taking other medications that can cause electrolyte imbalance or QT prolongation.

FDA Aug/11 The antidepressant citalopram (marketed as Celexa) should not be prescribed at doses above 40 mg/day because higher dosages can cause arrhythmias, the FDA has warned.

FDA Sep/11 The U.S. Food and Drug Administration (FDA) is informing the public of an ongoing safety review of the anti-nausea drug Zofran (ondansetron, ondansetron hydrochloride and their generics). Ondansetron may increase the risk of developing abnormal changes(QT prolongation & torsades) in the electrical activity of the heart.

Health Canada Aug/10 **Droperidol** Injection USP is associated with severe arrhythmia (eg. QT) and the Canadian Monograph of this product has been updated to reflect this risk.

Health Canada Nov/10 **Darvon-N (dextropropoxyphene) - Recall and Withdrawal in Canada** - Paladin Labs Inc. Paladin Labs Inc. in collaboration with Health Canada would like to inform healthcare professionals of the voluntary recall and withdrawal of the opioid analgesic Darvon-N (dextropropoxyphene) in Canada. (widen the QRS complex, prolong the QT interval and therefore increase the risk of serious abnormal heart rhythms.)

Health Canada Feb/12 has recently approved vandetanib (CAPRELSA) to treat medullary thyroid cancer in adult patients where either the tumour cannot be removed by surgery or it has spread from the thyroid gland to other parts of the body. CAPRELSA can cause serious QT heart rhythm changes which may result in sudden death, if left untreated.

Health Canada Mar/12: **Domperidone** should be used at the lowest possible dose. The risk of serious ventricular arrhythmias and sudden cardiac death may be higher in patients taking daily doses greater than 30 mg, and in patients over 60 years old.

Krantz MJ, Martin J, et al. QTc Interval Screening in **Methadone** Treatment. Ann Intern Med. 2009 Jan 19. [Epub ahead print]
450 Recommendation 1 (Disclosure): Clinicians should inform patients of arrhythmia risk when they prescribe methadone. Recommendation 2 (Clinical History): Clinicians should ask patients about any history of structural heart disease, arrhythmia, and syncope. Recommendation 3 (Screening): Obtain a pretreatment electrocardiogram for all patients to measure the QTc interval and a follow-up electrocardiogram within 30 days and annually. Additional electrocardiography is recommended if the methadone dosage exceeds 100 mg/d or if patients have unexplained syncope or seizures. Recommendation 4 (Risk Stratification): If the QTc interval is greater than ms but less than 500 ms, discuss the potential risks and benefits with patients and monitor them more frequently. If the QTc interval exceeds 500 ms, consider discontinuing or reducing the methadone dose; eliminating contributing factors, such as drugs that promote hypokalemia; or using an alternative therapy. Recommendation 5 (Drug Interactions): Clinicians should be aware of interactions between methadone and other drugs that possess QT interval-prolonging properties or slow the elimination of methadone.

Medical Letter –Treatment Guidelines: Drugs for Cardiac Arrhythmias. June 2007.

MHRA Dec/11 **Citalopram and escitalopram** are associated with dose-dependent QT interval prolongation and should not be used in those with: congenital long QT syndrome; known pre-existing QT interval prolongation; or in combination with other medicines that prolong the QT interval. ECG measurements should be considered for patients with cardiac disease, and electrolyte disturbances should be corrected before starting treatment. For citalopram, new restrictions on the maximum daily doses now apply: 40 mg for adults; 20 mg for patients older than 65 years; and 20 mg for those with hepatic impairment. For escitalopram, the maximum daily dose for patients older than 65 years is now reduced to 10 mg/day; other doses remain unchanged.

Health Canada Sept/07 is advising consumers not to use BuXie PaiDu XiaoDou Su is used as an acne treatment and was found to contain the prescription drug rifampicin (rifampin).
Health Canada Feb/10 Accutane has been associated with cases of severe skin reactions (e.g. toxic epidermal necrolysis, Stevens-Johnson syndrome and erythema multiforme).
iPLEDGE (The iPLEDGE program is a computer-based risk management program designed to further the public health goal to eliminate fetal exposure to isotretinoin through a special restricted distribution program approved by the FDA. The program strives to ensure that: No female patient starts isotretinoin therapy if pregnant & No female patient on isotretinoin therapy becomes pregnant . This enhanced program is a SINGLE pregnancy risk management program for prescribing and dispensing all isotretinoin products (brand and generic products). The iPLEDGE program requires registration of all wholesalers distributing isotretinoin, all healthcare professionals prescribing isotretinoin, all pharmacies dispensing isotretinoin, and all male and female patients prescribed isotretinoin. This program is designed to create a verifiable link between the negative pregnancy test and the dispensing of the isotretinoin prescription to the female patient of childbearing potential. The iPLEDGE program requires that all patients meet qualification criteria and monthly program requirements. Before the patient receives his/her isotretinoin prescription each month, the prescriber must counsel the patient and document in the iPLEDGE system that the patient has been counseled about the risks of isotretinoin. There are also additional qualification criteria and monthly requirements for female patients of childbearing potential. As part of the ongoing risk management of isotretinoin products, it is crucial that a female of childbearing potential selects and commits to use two forms of effective contraception simultaneously for one month before, during, and for one month after isotretinoin therapy. She must have 2 negative urine or blood (serum) pregnancy tests with a sensitivity of at least 25 mIU/ml before receiving the initial isotretinoin prescription. The first pregnancy test is a screening test and can be conducted in the prescriber's office. The second pregnancy test must be done in a CLIA-certified laboratory according to the package insert. Each month of therapy, the patient must have a negative result from a urine or blood (serum) pregnancy test conducted by a CLIA-certified laboratory prior to receiving each prescription. https://www.ipledgeprogram.com/

Efficacy and tolerability of topical pimecrolimus and tacrolimus in the treatment of atopic dermatitis: meta-analysis of randomised controlled trials. BMJ 2005; 330:516-25**.** (InfoPOEMs: In comparison studies to date, tacrolimus is as effective as steroids in adults and is more effective in the higher concentration (0.1%) than weak corticosteroids in children. Pimecrolimus was less effective than potent steroids in adults, and has not been studied compared with weak corticosteroids. Neither has been studied in patients with corticosteroid-resistant lesions. These are expensive alternatives to corticosteroids. The Unites States Food and Drug Administration has issued a caution linking these drugs to cancer, and does not recommend them for children younger than 2 years. (LOE = 1a))

Haeck IM, Rouwen TJ, Timmer-de Mik L, et al. Topical corticosteroids in atopic dermatitis and the risk of **glaucoma and cataracts.** J Am Acad Dermatol. 2011 Feb;64(2):275-81.

Kelso JM. Application of topical corticosteroids to sites of **positive immediate-type allergy skin tests** to relieve itching: results of a double-blind, placebo-controlled trial. Ann Allergy Asthma Immunol. 2007 Feb;98(2):182-4. The application of corticosteroid cream to sites of positive immediate-type allergy skin tests does not provide relief of itching; therefore, this practice should be abandoned. Instead, patients should be informed that any itching they may be experiencing will substantially resolve during the next 30 minutes and that application of such topical treatment will not hasten the relief of itching.

Kirtschig G, Middleton P, Bennett C, et al. Interventions for **bullous pemphigoid**. Cochrane Database Syst Rev. 2010 Oct 6;10:CD002292. Very potent topical steroids are effective and safe treatments for BP, but their use in extensive disease may be limited by side-effects and practical factors. Milder regimens (using lower doses of steroids) are safe and effective in moderate BP. Starting doses of prednisolone greater than 0.75 mg/kg/day do not give additional benefit, lower doses may be adequate to control disease and reduce the incidence and severity of adverse reactions. The effectiveness of adding plasma exchange, azathioprine or mycophenolate mofetil to corticosteroids, and combination treatment with tetracycline and nicotinamide needs further investigation.

Medscape Mar 18, 2010 - Drugs for eczema made by Novartis AG and Astellas Pharma may need their warning labels expanded after dozens of new reported cases of cancer and infection in children, U.S. Food and Drug Administration staff said in documents released on Thursday. Agency scientists said **46 cancer cases and 71 infection** cases have been reported in patients aged 16 and younger from 2004 to 2008 with Novartis' Elidel and Astellas' Protopic. Both drugs -- also known as pimecrolimus and tacrolimus respectively -- already carry strong warnings about cancer and infection, but officials should consider expanding them to include the new post-marketing reports, they wrote.

J Am Acad Dermatol 2009 Apr;60(4):643-59.

Paller AS, Lebwohl M, Fleischer AB, and the US/Canada Tacrolimus Ointment Study Group. **Tacrolimus** ointment is more effective than pimecrolimus cream with a similar safety profile in the treatment of atopic dermatitis: Results from 3 randomized, comparative studies. J Am Acad Dermatol 2005; 52:810-22.
(InfoPOEMs: Tacrolimus ointment is slightly more effective for the treatment of atopic dermatitis (AD) than pimecrolimus cream in pediatric and adult patients with moderate to severe disease. Adverse events are similar with both treatments. However, there is recent concern about the potential for an increased risk of skin cancer with prolonged use of either product. (LOE = 1b))

Paul C, et al. Safety and tolerability of 1% **pimecrolimus** cream among infants: experience with 1133 patients treated for up to 2 years. Pediatrics. 2006 Jan;117(1):e118-28. Epub 2005 Dec 15.

Reitamo S, Ortonne JP, Sand C, et al.; European Tacrolimus Ointment Study Group. A multicentre, randomized, double-blind, controlled study of long-term treatment with 0.1% **tacrolimus** ointment in adults with moderate to severe atopic dermatitis. Br J Dermatol. 2005 Jun;152(6):1282-9.

Reitamo S, Rustin M, Harper J, et al. the 0·1% Tacrolimus Ointment Long-term Follow-up Study Group. A **4-year follow-up** study of atopic dermatitis therapy with 0.1% **tacrolimus** ointment in children and adult patients. Br J Dermatol. 2008 Jul 15. [Epub ahead of print] n=782. The safety profile of intermittent or continuous long-term application of 0.1% tacrolimus ointment for up to 4 years was consistent with that which has been established from shorter studies and gave no reason for concern. In addition, 0.1% tacrolimus ointment demonstrated sustained efficacy as reflected by the expression of high satisfaction with treatment by both patients and investigators.

Rigopoulos D, et al. Tacrolimus ointment 0.1% in pityriasis alba: an open-label, randomized, placebo-controlled study. Br J Dermatol. 2006 Jul;155(1):152-5. (InfoPOEMs: **Tacrolimus is an option for the treatment of pityriasis alba** (PA). Note that this drug has not been approved for use in children younger than 2 years and should be used in all patients for as short a time as possible since long-term use has been associated with an increased risk of lymphoma and skin cancer. Since PA is a self-limiting condition, with patients in the control group improving throughout the study, this expensive and potentially harmful agent should only be used after a careful discussion of the risks and benefits with patients and their parents. Moisturizers, sun block, and low-dose corticosteroids are first-line treatments. (LOE = 1b))

Rustin MH. The safety of **tacrolimus** ointment for the treatment of atopic dermatitis: a review. Br J Dermatol. 2007 Nov;157(5):861-73. Epub 2007 Sep 13.

Schwarz T, Kreiselmaier I, Bieber T, et al. A randomized, double-blind, vehicle-controlled study of 1% pimecrolimus cream in adult patients with **perioral dermatitis**. J Am Acad Dermatol. 2008 Jul;59(1):34-40. Epub 2008 May 7. Adults with perioral dermatitis clinically improve faster with 1% pimecrolimus cream (Elidel) compared with inactive placebo, but after 1 month there is no longer any significant difference in response rates between active and control therapy. In this study, the subgroup of patients with a history of topical corticosteroid use received significantly more benefit from pimecrolimus cream. (LOE = 1b-)

van Velsen SGA et al. **Bone mineral density** in children with moderate to severe atopic dermatitis. J Am Acad Dermatol 2010 Nov; 63:824.

Useful tables from Canadian Glaucoma Guidelines 2009:

Table 19—Staging each eye for glaucoma damage

Suspect	One or two of the following: IOP >21 mm Hg; suspicious disc or cup to disc (C/D) asymmetry of >0.2; suspicious 24-2 (or similar) VF defect
Early	Early glaucomatous disc features (e.g. C/D* <0.65) and (or) mild VF defect not within 10° of fixation (e.g. MD better than –6 dB on HVF 24-2)
Moderate	Moderate glaucomatous disc features (e.g. vertical C/D* 0.7–0.85) and (or) moderate VF defect not within 10° of fixation (e.g. MD from –6 to –12 dB on HVF 24-2)
Advanced	Advanced glaucomatous disc features (e.g. C/D* >0.9) and (or) VF defect within 10° of fixation† (e.g. MD worse than –12 dB on HVF 24-2)

Adapted from Damji et al.[160]

Please refer to text in order to decide whether a nerve exhibits characteristics of glaucomatous damage.
*Refers to vertical C/D ratio in an average size nerve. If the nerve is small, then a smaller C/D ratio may still be significant; conversely, a large
nerve may have a large vertical C/D ratio and still be within normal limits.
†Also consider baseline 10-2 VF (or similar)
Note: MD, mean deviation; HVF, Humphrey Visual Field Analyzer.

Table 20—Suggested upper limit of initial target IOP for each eye

Stage	Suggested upper limit of target IOP. Modify based on longevity, QOL and risk factors for progression	Evidence
Suspect in whom a clinical decision is made to treat	24 mm Hg with at least 20% reduction from baseline	OHTS,[47] EGPS[325]
Early	20 mm Hg with at least 25% reduction from baseline	EMGTS,[48] CIGTS[326]
Moderate	17 mm Hg with at least 30% reduction from baseline	CNTGS,[12] AGIS[11]
Advanced	14 mm Hg with at least 30% reduction from baseline	AGIS,[11] Odberg[327]

Adapted from Damji et al.[160]

Note: Target IOP may need to be adjusted during the course of follow-up. Extremes of CCT may be helpful in the setting of target IOP. For example, if the cornea is very thin, this may encourage a more aggressive approach with more frequent follow-up.[161]

Table 21—Advantages and disadvantages of single and combined cataract and glaucoma procedures

Procedure	Advantages	Disadvantages
Phacoemulsification alone	Quick procedure with more rapid visual recovery	Postoperative IOP spike is a potential risk, particularly in patients with advanced VF loss
	Improved vision, which benefits QOL	Not regarded as a consistent or powerful means of lowering IOP
	May lower IOP a small amount in some patients	IOP should be watched closely in both the early postoperative period and later
Trabeculectomy alone	Quicker than combined procedure	Will not improve vision
	May achieve superior long-term IOP lowering than combined procedure or cataract alone	May cause or worsen cataract
Combined procedure	Minimizes anesthetic risk by combining 2 procedures in 1	May not be as effective at long-term IOP control as trabeculectomy alone
	Convenience to patient with 1 trip to operating room rather than 2	Increased risk of complications with 2 procedures rather than 1
	Cost savings	Slower visual recovery than doing cataract alone
	May blunt potentially damaging postoperative IOP spikes in patients with advanced VF loss	
	Opportunity to improve IOP control and improve vision at the same time with enhanced QOL

FDA: Nov/07 Cosmetic Eyelash-Lengthener Seized The FDA says U.S. marshals have seized more than 12,000 applicator tubes of Age Intervention Eyelash, a cosmetic promoted to increase eyelash growth, because of concerns it may cause eye damage. In a press release the agency said that the product is an "adulterated cosmetic" because it contains bimatoprost (Lumigan), used to treat elevated intraocular pressure. In patients taking the prescription drug, the agency said the extra dose of bimatoprost may decrease the treatment's effectiveness, leading to optic nerve damage. Other side effects could include macular edema and uveitis.The cosmetic's maker, Jan Marini Skin Research, responded that no cases of eye damage have been reported. It said it reformulated the product last year to remove bimatoprost and that "several other companies have copied [Marini's] discontinued product and continue to market their competing products with 'drug' claims for eyelash growth."

NICE April 2009 -- The National Institute for Health and Clinical Excellence (NICE) and the National Clinical Guideline Centre will issue a guideline to improve the diagnosis and management of chronic open angle glaucoma (COAG) and ocular hypertension (OHT). People who have COAG, who are suspected of having COAG or who have OHT should be offered a suite of tests including assessments of the eye pressure, the thickness of the cornea, the drainage area in the eye and field of vision, and an assessment and image of the appearance of the optic nerve heads. People at risk of developing glaucoma should be monitored regularly using tests similar to those used to diagnose glaucoma. The frequency of these tests will depend on how high the risk is of developing glaucoma. Clarity on monitoring intervals for testing people who have glaucoma or are at risk of developing it, and recommendations on follow-up of patients who turn out not to have glaucoma after a period of careful monitoring. Treatment with prostaglandins or beta-blockers to reduce high eye pressure in people with glaucoma or those at risk of the condition. After previous treatment switches, earlier consideration of alternative treatments for worsening glaucoma, such as surgery or laser treatment to avoid disease progression. The guidance will be available at http://www.nice.org.uk/CG85

Bhasin S, et al. Testosterone therapy in adult men with androgen deficiency syndromes: an **endocrine society clinical practice guideline**. J Clin Endocrinol Metab. **2006** Jun;91(6):1995-2010. Epub 2006 May 23. Erratum in: J Clin Endocrinol Metab. 2006 Jul;91(7):2688. We recommend making a diagnosis of androgen deficiency only in men with consistent symptoms and signs and unequivocally low serum testosterone levels. We suggest the measurement of morning total testosterone level by a reliable assay as the initial diagnostic test. We recommend confirmation of the diagnosis by repeating the measurement of morning total testosterone and in some patients by measurement of free or bioavailable testosterone level, using accurate assays. We recommend testosterone therapy for symptomatic men with androgen deficiency, who have low testosterone levels, to induce and maintain secondary sex characteristics and to improve their sexual function, sense of well-being, muscle mass and strength, and bone mineral density. We recommend against starting testosterone therapy in patients with breast or prostate cancer, a palpable prostate nodule or induration or prostate-specific antigen greater than 3 ng/ml without further urological evaluation, erythrocytosis (hematocrit > 50%), hyperviscosity, untreated obstructive sleep apnea, severe lower urinary tract symptoms with International Prostate Symptom Score (IPSS) greater than 19, or class III or IV heart failure. When testosterone therapy is instituted, we suggest aiming at achieving testosterone levels during treatment in the mid-normal range with any of the approved formulations, chosen on the basis of the patient's preference, consideration of pharmacokinetics, treatment burden, and cost. Men receiving testosterone therapy should be monitored using a standardized plan.
Bhasin S, Cunningham GR, Hayes FJ, et al. **Testosterone therapy in men with androgen deficiency syndromes**: an **Endocrine Society clinical practice** guideline. Bodybuilding.com and FDA Nov/09 notified healthcare professionals and patients of a nationwide and international recall of all lots and expiration dates of 65 dietary supplement products that were sold through the Company's website, www.bodybuilding.com. FDA believes that the recalled products contain the following ingredients that are currently classified, or the FDA believes should be classified, as steroids: **"Superdrol," "Madol," "Tren," "Androstenedione," and/or "Turinabol."** Acute liver injury is known to be a possible harmful effect of using steroid-containing products. In addition, steroids may cause other serious long-term adverse health consequences in men, women, and children. These include shrinkage of the testes and male infertility, masculinization of women, breast enlargement in males, short stature in children, a higher predilection to misuse other drugs and alcohol, adverse effects on blood lipid levels, and increased risk of heart attack, stroke, and death.

Braunstein GD, et al. Safety & efficacy of a testosterone patch for the treatment of hypoactive sexual desire in surgically menopausal **women**: a randomized, placebo-controlled trial. Arch Intern Med. 2005 Jul 25;165(14):1582-9.

Davis SR, Davison SL, Donath S, Bell RJ. Circulating androgen levels and self-reported sexual function in **women**. JAMA. 2005 Jul 6;294(1):91-6. CONCLUSIONS: No single androgen level is predictive of low female sexual function, and the majority of women with low dehydroepiandrosterone sulfate levels did not have low sexual function. (InfoPOEMs: Low total testosterone and free testosterone levels are not associated with low sexual desire and function in women. A serum dehydroepiandrosterone sulfate (DHEA) level below the aged-adjusted 10th percentile is a better marker for low sexual desire and function, but the majority of women with a low DHEA level do not have sexual dysfunction. There is no evidence to support measurement of serum testosterone in women with low sexual desire or function. The practice of prescribing exogenous testosterone for women with low sexual desire or function requires further study and should not be routine. (LOE = 2c))

Effect of testosterone supplementation on functional mobility, cognition, and other parameters in older men: a randomized controlled trial. JAMA. 2008 Jan 2;299(1):39-52. Testosterone supplementation during 6 months to older men with a low normal testosterone concentration did not affect functional status or cognition but increased lean body mass and had mixed metabolic effects.

Endogenous Hormones, Prostate Cancer Collaborative Group, Roddam AW, Allen NE, Appleby P, Key TJ. **Endogenous sex hormones and prostate cancer**: a collaborative analysis of 18 prospective studies J Natl Cancer Inst. 2008 Feb 6;100(3):170-83. Epub 2008 Jan 29. In this collaborative analysis of the worldwide data on endogenous hormones and prostate cancer risk, serum concentrations of sex hormones were not associated with the risk of prostate cancer.

FDA May/09 notified healthcare professionals that it will require two prescription topical testosterone gel products, AndroGel 1% and Testim 1%, to include a boxed warning on the products' labels after receiving reports of adverse effects in **children** who were **inadvertently exposed** to testosterone through contact with another person being treated with these products. Of the fully reviewed cases, adverse events reported in these **children** included inappropriate enlargement of the genitalia (penis or clitoris), premature development of pubic hair, advanced bone age, increased libido and aggressive behavior.

FDA Aug/09 not to use body-building products marketed as containing **steroids or steroid-like substances** such as TREN-Xtreme, MASS Xtreme, ESTRO Xtreme, AH-89-Xtreme, HMG Xtreme, MMA-3 Xtreme, VNS-9 Xtreme, and TT-40-Xtreme..

FDA Nov/09 & IDS Sports notified consumers that five of the IDS's dietary supplement products (**Bromodrol, Dual Action Grow Tabs, Grow Tabs, Mass Tabs, and Ripped Tabs TR**) contain the following undeclared substances, which FDA considers to be steroids: "Madol," "Turinabol," "Superdrol," &/or "Androstenedione."

FDA Dec/09 for **S-DROL**: a voluntary recall by the manufacturer of one lot (lot# 810481, expiry date 01/2012) of S-DROL after FDA testing found it to contain undeclared desoxymethyltestosterone.

FDA Dec/09 warned consumers to stop using bodybuilding products manufactured by American Cellular Labs after they were found to contain unauthorized synthetic steroids in **TREN-Xtreme, MASS Xtreme, ESTRO Xtreme, AH-89-Xtreme, HMG Xtreme, MMA-3 Xtreme, VNS-9 Xtreme, TT-40-Xtreme.**

FDA Jan/10 & **MuscleMaster(dot)com**, Inc. notified consumers and healthcare professionals of the voluntary nationwide recall of all lots and expiration dates of the seventeen dietary supplements listed in the firm press release, sold between June 1, 2009 and November 17, 2009. FDA informed MuscleMaster(dot)com that it believes that the recalled products contain ingredients that are **steroids**.

FDA Oct/11 notified the manufacturer that lab analyses found that the product; **Uprizing 2.0** , sold as a testosterone booster, contains **superdrol**, a synthetic steroid, making it an unapproved new drug.

Nair KS, et al. **DHEA** (50mg) in elderly **women** and DHEA (75mg) or testosterone in **elderly men**. N Engl J Med. 2006 Oct 19;355(16):1647-59. (n= 2yr 87 males, 57 women) Men who received testosterone had a slight increase in fat-free mass, and men in both treatment groups had an increase in BMD at the femoral neck. Women who received DHEA had an increase in BMD at the ultradistal radius. Neither DHEA nor low-dose testosterone replacement in elderly people has physiologically relevant beneficial effects on body composition, physical performance, insulin sensitivity, or quality of life. {InfoPOEMS: There is no evidence that supplementation with dehydroepiandrosterone (DHEA) or testosterone has any meaningful clinical benefit for older patients with low serum levels of those hormones.}
North American Menopause Society. NAMS Board of Trustees. The role of testosterone therapy in postmenopausal **women**: position statement of The North American Menopause Society. Menopause. 2005 Sep 1;12(5):497-511 [Epub ahead of print] CONCLUSIONS:
Postmenopausal women with decreased sexual desire associated with personal distress and with no other identifiable cause may be candidates for testosterone therapy. Testosterone treatment without concomitant estrogen therapy cannot be recommended because of a lack of evidence. When evaluating awoman for testosterone therapy, recommendations are to rule out causes not related to testosterone levels (eg, physical and psychosocial factors, medications) and to ensure that there is a physiologic cause for reduced testosterone levels (eg, bilateral oophorectomy). Laboratory testing of testosterone levels should be used only to monitor for supraphysiologic levels before and during therapy, not to diagnose testosterone insufficiency. Monitoring should also include subjective assessments of sexual response, desire, and satisfaction as well as evaluation for potential adverse effects. Transdermal patches and topical gels or creams are preferred over oral products because of first-pass hepatic effects documented with oral formulations. Custom-compounded products should be used with caution because the dosing may be more inconsistent than it is with government-approved products. Testosterone products formulated specifically for men have a risk of excessive dosing, although some clinicians use lower doses of these products in women. Testosterone therapy is contraindicated in women with breast or uterine cancer or in those with cardiovascular or liver disease. It should be administered at the lowest dose for the shortest time that meets treatment goals. Counseling regarding the potential risks and benefits should be provided before initiating therapy.

Kheirandish-Gozal L, Gozal D. Intranasal budesonide treatment for children with mild obstructive **sleep apnea syndrome**. Pediatrics. 2008 Jul;122(1):e149-55. A 6-week treatment with intranasal budesonide effectively reduced the severity of mild obstructive sleep apnea syndrome and the magnitude of the underlying adenoidal hypertrophy, and this effect persisted for at least 8 weeks after cessation of therapy. These findings justify the use of topical steroids as the initial therapeutic option in otherwise healthy children with mild obstructive sleep apnea.

Extras – RxFiles.ca – Oral Hypoglycemics

Hypoglycemics & Sulfa Allergy

Articles: http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1783707/?tool=pubmed
Pharmacist's Letter document (Canadian Pharmacist's Letter 2010; 26(6):260601).

Summary & Overview:

⇨Warnings don't always correspond with available evidence; there is little information to suggest cross-sensitivity among the different sulfa chemical classes, however, those who have experienced a previous allergic reaction (to any drug) are more likely to experience a subsequent allergic reaction (to a related or unrelated drug)

⇨ Specific drugs

- *Chlorpropamide (Diabinese) (Apo-Chlorpropamide - Canada) - no warning*
- *Gliclazide (Diamicron) – Warning- (Contraindicated-Health Canada)*
- *Glimepiride (Amaryl)- Warning- (Contraindicated-Health Canada)*
- *Glipizide (Glucotrol)- no warning*
- *Glyburide (DiaBeta, others) - Warning (Contraindicated-Health Canada)*
- *Tolbutamide (Orinase) (Apo-Tolbutamide - Canada) - Warning*

⇨One case report of contact dermatitis with tolbutamide in a patient with sensitivity to sulfanilamide vaginal cream. After discontinuation of tolbutamide, therapy was changed to chlorpropamide, which was tolerated without difficulty.
⇨Another case report describes an allergic reaction to glyburide in a patient with a known allergy to sulfamethoxazole.

Callaghan BC, Little AA, Feldman EL, Hughes RAC. Enhanced **glucose control for preventing and treating diabetic neuropathy**. Cochrane Database of Systematic Reviews 2012, Issue 6. Art. No.: CD007543. According to high-quality evidence, enhanced glucose control significantly prevents the development of clinical neuropathy and reduces nerve conduction and vibration threshold abnormalities in type 1 diabetes mellitus. In type 2 diabetes mellitus, enhanced glucose control reduces the incidence of clinical neuropathy, although this was not formally statistically significant (P = 0.06). However, enhanced glucose control does significantly reduce nerve conduction and vibration threshold abnormalities. Importantly, enhanced glucose control significantly increases the risk of severe hypoglycemic episodes, which needs to be taken into account when evaluating its risk/benefit ratio.

FDA Aug/09 Patients with diabetes who take therapeutic products containing nonglucose sugars (e.g., **peritoneal dialysis solution and some immunoglobulins**) can have falsely elevated readings from blood glucose test strips that use glucose dehydrogenase pyrroloquinoline quinone (**GDH-PQQ**) technology, according to an FDA public health notification. The strips are in wide use, and we have provided a link to a listing of the affected products. The FDA cites 13 deaths associated with hypoglycemia not detected by the test strips, which cannot distinguish between lucose and other sugars such as maltose and xylose. Ten patients were receiving icodextrin peritoneal dialysis solution. The FDA advises physicians to avoid using GDH-PQQ test strips in health care facilities and to rely, instead, on laboratory assays of glucose — especially in patients taking the therapeutic products listed in the alert. Interfering products containing nonglucose sugars include icodextrin peritoneal dialysis solution, certain immunoglobulins, abatacept (Orencia, Bristol-Myers Squibb), tositumomab (Bexxar, GlaxoSmithKline), and any product containing or metabolized into maltose, galactose, or xylose. Several test strips and associated monitors use GDH-PQQ methodology: ACCU-CHEK (Roche), FreeStyle (Abbott Diabetes Care), TRUEtest (Home Diagnostics), CoZmonitor blood glucose module (for use with the Deltec Cozmo insulin pump, Smiths Medical MD), and OmniPod insulin management system (Insulet).

FDA Sep/10 & Takeda, conducted a planned analysis of the study data at the five-year mark, and submitted their results to FDA. Overall, there was no statistically significant association between **Actos exposure and bladder cancer risk**. However, further analyses were also performed looking at how long patients were on Actos and the total amount of the drug they received during that time. An increased risk of bladder cancer was observed among patients with the longest exposure to Actos, as well as in those exposed to the highest cumulative dose of Actos. FDA notified healthcare professionals and patients that the Agency is reviewing data from an ongoing, ten-year epidemiological study designed to evaluate whether Actos (pioglitazone) is associated with an increased risk of bladder cancer.

Health Canada Apr/07 is warning consumers from The Hong Kong Department of Health found **Lanmei Keili Ji to be adulterated with gliclazide**, a hypoglycaemic agent (lowers blood sugar).
Health Canada May/07 is advising consumers not to use **Xiaokeshuping Jiangtangning Jiaonang** capsules in Hong Kong to contain the undeclared pharmaceutical drugs phenformin, rosiglitazone, and glibenclamide, which may be used in diabetes to lower blood sugar.
Health Canada May& June/07 is advising consumers & health professionals about heart risks with **Avandia** http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/public/2007/avandia_pc-cp_3_e.html
Health Canada Sept/07 is advising consumers not to use foreign health products due to concerns about possible side-effects: **Jacaranda**, **Queenmer Fat Loss**, **Li Da Dai Dai Hua Jiao Nang, J-minus** and **Jelimel Slimming Capsules**. These products are promoted for weight loss and have been found to be adulterated with the prescription drug sibutramine. Sibutramine is used for treating obesity and should only be taken under the supervision of a health professional. **Junyu Jiaonanyihao** has been found to contain the undeclared prescription drugs sibutramine and dexamethasone, as well as phenolphthalein, which is currently prohibited in Canada.. **Heng Tong Jiangtangning Jiaonang** was found to contain the prohibited drug phenformin, and the prescription drug glibenclamide (glyburide) which should only be taken under the supervision of a health professional.
Health Canada Nov/07 Rosiglitazone (**AVANDIA**®) is no longer approved as monotherapy for type 2 diabetes, except when metformin use is contraindicated or not tolerated. Rosiglitazone is no longer approved for use in combination with a sulfonylurea, except when metformin is contraindicated or not tolerated. Treatment with all rosiglitazone products is now contraindicated in patients with any stage of heart failure (i.e., NYHA Class I, II, III or IV).
Health Canada April/08 warns that Singapore's Health Sciences Authority (HSA) advised the public not to use the product **Power 1 Walnut**, because it was found to contain the prescription drugs sildenafil and glibenclamide.
Health Canada April/08 is advising consumers not to use The Hong Kong Department of Health advised the public not to use the product **Tian Sheng Yi Bao** because it was found to contain two pharmaceutical products, glibenclamide and phenformin.
Health Canada June/08 **Nangen Zengzhangsu** (may also be known as Nangen or Nangeng), Sanbianwan, Jiu Bian Wang, Tian Huang Gu Shen Dan, Zui Xian Dan Gong Shi Zi, and Power Up. The Hong Kong Department of Health has warned consumers not to use these herbal/proprietary Chinese medicine products promoted for erectile dysfunction because they have been found to contain sildenafil and/or glibenclamide.

TOP

Health Canada June/08 **Zhong Hua Niu Bian**. Zhong Hua Niu Bian is an herbal/proprietary Chinese medicine product promoted for erectile dysfunction. Singapore's Health Sciences Authority has warned against the use of this product because it has been found to contain sildenafil, glibenclamide, tadalafil and sibutramine

Health Canada Nov/08 is advising consumers not to use foreign health products due to concerns about possible side-effects: The Hong Kong Department of Health warned consumers not to buy or use **Lu Quan** because it contains undeclared glibenclamide and sildenafil.

Health Canada Nov/10 AVANDIA®/AVANDAMET®/AVANDARYL® is now indicated only in patients with type 2 diabetes mellitus for whom all other oral antidiabetic agents, in monotherapy or in combination, do not result in adequate glycemic control or are inappropriate due to contraindications or intolerance. Prior to starting or renewing a prescription for **AVANDIA®/AVANDAMET®/ AVANDARYL®,** physicians should consider whether a rosiglitazone-containing product is an appropriate therapeutic choice, and if so: Document the eligibility of patients to meet the above criteria; Counsel each patient on the risks and benefits of AVANDIA®/AVANDAMET®/ AVANDARYL®, including the cardiovascular risks; and Obtain the patient's written informed consent to take the drug.

Health Canada Nov/11 **Pancre-Plus** The Hong Kong Department of Health warned that this counterfeit Chinese medicine contains an unauthorized drug (phenformin) and a prescription drug (glyburide). **Tian Ma Tu Chung Seven Leave Ginseng, Vall-Boon Tongkat Al, and Pao Ni Kang** The Singapore Health Sciences Authority warned that these traditional herbal products contain prescription and over-the-counter drugs (dexamethasone, ketoconazole, repaglinide, pheniramine, and chlorpheniramine).

Health Canada Apr/12 has recently completed a safety assessment of the available data for **rosiglitazone-ACTOS**, an oral anti-diabetic drug, and the label was updated to reflect the potential risk of **bladder cancer** in treated patients.

Health Canada May/12 1. **Jin Yu Tang Tai Han Kang Pai Pu Ling Jiao Nang; TangBaoKouFuYiDaoSuJiaoNang; Tangren 365 Kangxunpai sangge huoyisu jiaonang; Tong Ren Xiu Fu Kou Fu Yi Dao Su.** The Hong Kong Department of Health warned that these products contain a combination of prescription drugs (metformin, glibenclamide [also known as glyburide], rosiglitazone, glimepiride, hydrochlorothiazide) and unauthorized drugs (phenolphthalein, phenformin).

Hemmingsen B, Lund SS, Gluud C, et al. Targeting **intensive glycaemic control versus targeting conventional glycaemic control** for type 2 diabetes mellitus. Cochrane Database of Systematic Reviews 2011, Issue 6. Art. No.: CD008143. DOI: 10.1002/14651858.CD008143.pub2. The included trials did not show significant differences for all-cause mortality and cardiovascular mortality when targeting intensive glycaemic control compared with conventional glycaemic control. Targeting intensive glycaemic control reduced the risk of microvascular complications while increasing the risk of hypoglycaemia. Furthermore, intensive glycaemic control might reduce the risk of non-fatal myocardial infarction in trials exclusively dealing with glycaemic control in usual care settings.

Kahn SE, Haffner SM, Heise MA, et al. Glycemic Durability of Rosiglitazone, Metformin, or Glyburide Monotherapy. (**ADOPT** trial) N Engl J Med. 2006 Dec 4; [Epub ahead of print] Calculated monotherapy failure at 5 years was 15% with rosiglitazone, 21% with metformin, and 34% with glyburide. Kaplan-Meier analysis showed a cumulative incidence of monotherapy failure at 5 years of 15% with rosiglitazone, 21% with metformin, and 34% with glyburide. This represents a risk reduction of 32% for rosiglitazone, as compared with metformin, and 63%, as compared with glyburide (P<0.001 for both comparisons). The difference in the durability of the treatment effect was greater between rosiglitazone and glyburide than between rosiglitazone and metformin. Glyburide was associated with a lower risk of cardiovascular events (including congestive heart failure) than was rosiglitazone (P<0.05), and the risk associated with metformin was similar to that with rosiglitazone. Rosiglitazone was associated with more weight gain, edema and fractures than either metformin or glyburide but with fewer gastrointestinal events than metformin and with less hypoglycemia than glyburide (P<0.001 for all comparisons). An editorialist criticizes the study's use of fasting glucose rather than glycated hemoglobin to ascertain failure. When looked at from the latter standpoint, he writes, rosiglitazone shows "a clinically less impressive effect. "Given the modest glycemic benefit of rosiglitazone (with the risk of fluid retention & weight gain) & higher cost (including the need for more statins and diuretics), metformin remains the logical choice when initiating pharmacotherapy for type 2 diabetes. (**n=4360 median 4yrs**) .Feb/07 Health Canada Avandia fracture warning: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2007/avandia_hpc-cps_3_e.html & May/07 for Actos http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2007/actos_hpc-cps_2_e.html

Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.

N Engl J Med. 2005 Dec 22;353(25):2643-53. (InfoPOEMs: This extension of the Diabetes Control and Complications Trial (DCCT) trial provides the first high-quality evidence that intensive treatment of Type 1 diabetes reduces the risk of adverse cardiovascular outcomes. Although the relative risk reduction was greater than 50%, the absolute risk reduction (0.42 per 100 patient years; NNT=25 over 10years) was modest. Note that this effect has not been shown in patients with Type 2 diabetes, although many patients and physicians believe otherwise, and data regarding all-cause mortality or adverse effects of intensive treatment (such as hypoglycemic episodes or traffic accidents) are not reported.. (LOE = 1b)) Diabetes Control and Complications Trial/Epidemiology of Diabetes Interventions and Complications (DCCT/EDIC) Research Group. Arch Intern Med. 2006 Feb 13;166(3):285-93. (InfoPOEMs: People interested in weight loss can choose either a low-fat, reduced calorie diet or a low-carbohydrate, non-calorie-restricted diet to lose a small but sustained amount of weight. The effect on cardiovascular outcomes of either diet are not known, though each has different effects on lipid levels, which may or may not translate into an actual effect on patient-oriented outcomes that matter. (LOE = 1a))
Norris SL, Kansagara D, Bougatsos C, Fu R; U.S. Preventive Services Task Force. **Screening adults** for type 2 diabetes: a review of the evidence for the U.S. Preventive Services Task Force. Ann Intern Med. 2008 Jun 3;148(11):855-68. Review. Summary for patients in: Ann Intern Med. 2008 Jun 3;148(11):I30. Direct evidence is lacking on the health benefits of detecting type 2 diabetes by either targeted or mass screening, and indirect evidence also fails to demonstrate health benefits for screening general populations. Persons with hypertension probably benefit from screening, because blood pressure targets for persons with diabetes are lower than those for persons without diabetes. Intensive lifestyle and pharmacotherapeutic interventions reduce the progression of prediabetes to diabetes, but few data examine the effect of these interventions on long-term health outcomes.

Richter B, Bandeira-Echtler E, Bergerhoff K, Clar C, Ebrahim Sh. **Rosiglitazone** for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2007 Jul 18;(3):CD006063. Eighteen trials which randomised 3888 people to rosiglitazone treatment were identified. Longest duration of therapy was four years with a median of 26 weeks. Published studies of at least 24 weeks rosiglitazone treatment in people with type 2 diabetes mellitus did not provide evidence that patient-oriented outcomes like mortality, morbidity, adverse effects, costs and health-related quality of life are positively influenced by this compound. Metabolic control measured by glycosylated haemoglobin A1c (HbA1c) as a surrogate endpoint did not demonstrate clinically relevant differences to other oral antidiabetic drugs. Occurrence of oedema was significantly raised (OR 2.27, 95% confidence interval (CI) 1.83 to 2.81). The single large RCT (ADOPT - A Diabetes Outcomes Progression Trial) indicated increased cardiovascular risk.
Richter B, Bandeira-Echtler E, et al.. **Pioglitazone** for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2006 Oct 18;(4):CD006060. Until new evidence becomes available, the benefit-risk ratio of pioglitazone remains unclear. Different therapeutic indications for pioglitazone of the two big U.S. and European drug agencies should be clarified to reduce uncertainties amongst patients and physicians.

Saenz A, Fernandez-Esteban I, Mataix A, et al. Metformin monotherapy for type 2 diabetes mellitus. **Cochrane** Database Syst Rev. 2005 Jul 20;(3):CD002966. CONCLUSIONS: Metformin may be the first therapeutic option in the diabetes mellitus type 2 with overweight or obesity, as it may prevent some vascular complications, and mortality. Metformin produces beneficial changes in glycaemia control, and moderated in weight, lipids, insulinaemia and diastolic blood pressure. Sulphonylureas, alpha-glucosidase inhibitors, thiazolidinediones, meglitinides, insulin, and diet fail to show more benefit for glycaemia control, body weight, or lipids, than metformin.

Lancet. 2006 Nov 11;368(9548):1660-72. (n=1047 1yr) These data indicate that 20 mg/day rimonabant, in combination with diet and exercise, can produce a clinically meaningful reduction in bodyweight and improve HbA1c and a number of cardiovascular and metabolic risk factors in overweight or obese patients with type 2 diabetes inadequately controlled by metformin or sulphonylureas.

van Dam RM, Hu FB. Coffee consumption and risk of type 2 diabetes. A systematic review. JAMA 2005; 294:97-104. (InfoPOEMs Habitual coffee drinking is associated with a reduced risk for type 2 diabetes. The lowest risk reduction occurred among individuals consuming 6 or more cups of filtered coffee daily. Decaffeinated and caffeinated brews are equally effective. (LOE = 2a-):)
Van de Laar FA, Lucassen PL, Akkermans RP, et al. Alpha-glucosidase inhibitors for type 2 diabetes mellitus. Cochrane Database Syst Rev. 2005 Apr 18;(2):CD003639 & ACP Journal Club . AUTHORS' CONCLUSIONS: It remains unclear whether alpha-glucosidase inhibitors influence mortality or morbidity in patients with type 2 diabetes. Conversely, they have a significant effect on glycemic control and insulin levels, but no statistically significant effect on lipids and body weight. These effects are less sure when alpha-glucosidase inhibitors are used for a longer duration. Acarbose dosages higher than 50 mg TID offer no additional effect on glycated hemoglobin but more adverse effects instead. Compared to sulphonylurea, alpha-glucosidase inhibitors lower fasting and post-load insulin levels and have an inferior profile regarding glycemic control and adverse effects.
van der Heijden AA, Ortegon MM, Niessen LW, et al. Prediction of coronary heart disease risk in a general, pre-diabetic, and diabetic population during 10 years of follow-up: accuracy of the Framingham, SCORE, and UKPDS risk functions: The Hoorn Study. Diabetes Care. 2009 Nov;32(11):2094-8. The use of the Framingham function for prediction of the first CHD event is likely to overestimate an individual`s absolute CHD risk. In CHD prevention, application of the **SCORE and UKPDS** functions might be useful in the absence of a more valid tool.

Welschen LM, Bloemendal E, Nijpels G, Dekker JM, Heine RJ, Stalman WA, Bouter LM. Self-monitoring of blood glucose in patients with type 2 diabetes who are not using insulin. Diabetes Care 2005; 28:1510-17. (InfoPOEMs: Intensive monitoring of blood glucose in patients with type 2 diabetes not using insulin results in a small decrease in hemoglobin A1c (HbA1c) levels but does not change fasting blood glucose levels. Urine glucose monitoring works just as well. More casual monitoring of blood glucose, such as once a day, has not been studied. There is a strong possibility that the weak study design was largely responsible for the difference seen in the study. Blood glucose monitoring is expensive: At the intense level of monitoring used in some of these studies (6 times a day), the cost of the monitoring strips alone can be $2000 US per year. (LOE = 1a))
Wen CP, et al. Increased mortality risks of pre-diabetes (**impaired fasting glucose**) in Taiwan. Diabetes Care. 2005 Nov;28(11):2756-61. CONCLUSIONS: There was an overall J-shaped relationship between all-cause mortality and FBG. IFG, when defined as 110-125 mg/dl, is an independent risk factor and should be aggressively treated as a disease because its subsequent mortality risks for CVD and diabetes were significantly increased. The newly defined IFG at 100-125 mg/dl did not have the predictive power for later increases in CVD or diabetes mortality.
Weng J, Li Y, Xu W, et al. Effect of intensive insulin therapy on beta-cell function and glycaemic control in patients with newly diagnosed type 2 diabetes: a multicentre randomized parallel-group trial. Lancet. 2008 May 4;371(9626):1753-1760. Early intensive insulin therapy in patients with newly diagnosed type 2 diabetes has favourable outcomes on recovery and maintenance of beta-cell function and protracted glycaemic remission compared with treatment with oral hypoglycaemic agents.
Wernicke JF, et al. A randomized controlled trial of **duloxetine** in diabetic peripheral **neuropathic** pain. Neurology. 2006 Oct 24;67(8):1411-20. (InfoPOEMs: In this study, duloxetine (Cymbalta) 60 mg daily was more effective than placebo in reducing pain from neuropathy in pts with diabetes. Higher doses of duloxetine didn't provide much additional benefit. The biases in this study favor treatment, so it is likely that the real benefit is less than what these investigators observed. Finally, we don't know if duloxetine is any more effective than other treatments used for painful diabetic neuropathy. (LOE = 2b-))

Health Canada – Advisory on rosiglitazone (Avandia) (June 01, 2007) http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2007/avandia_hpc-cps_4_e.html

Important Advice for Managing Your Patients

In Canada, Avandia® is NOT approved for use:
- with insulin therapy
- with the combination of metformin AND a sulfonylurea
- in patients with pre-diabetes.

Avandia® is contraindicated in patients with NYHA Class III and IV cardiac status.
Avandia® should be used with caution in any patient with NYHA Class I and II cardiac status.
All patients should be monitored for signs and symptoms of fluid retention, edema, and rapid weight gain.

The dose of Avandia® used in combination with a sulfonylurea should not exceed 4mg daily.

More links, information and a RxFiles Q&A Summary available at: http://www.rxfiles.ca/Rosiglitazone-CV-Controversy.htm

TOP

Background considerations:

- Weighing the benefits & risks of intensive therapy: [See also Diabetes - Landmark Outcome Trials Chart[24]]
  - The results of clinical trials evaluating outcomes of intensive glycemic control have been somewhat disappointing. Achieving an A1C of less than 6.5% may ↓ microvascular endpoints, but over 100,000 patient years of RCT data have failed to show a benefit on CV endpoints.[25] {The 10 year observational follow-up to the UKPDS suggests CV benefit of intensive glycemic control (FBG <6; mean baseline A1Cs 7.9% vs 8.5%) especially with metformin.[26]}
  - Individualization of antihyperglycemic therapy has become a common theme[27,28] as some evidence & experience suggests that some patients may do worse with more intensive regimens (e.g. ↑ mortality (NNH=95/3.5yrs) in the ACCORD RCT n=10,251 in patients randomized to achieve an intensive A1c of 6% vs 7 - 8%; actual A1c achieved was 6.4% vs 7.5%)[29].
  - Although an A1C of <7% is suggested for most, individual patient & treatment regimen factors may result in acceptance of less aggressive targets. For example the American Geriatric Society[30] noted that an A1C of 8% may be more suitable in frail elderly & those with a life expectancy <5yrs.
  - A recent observational cohort trial found a "U" shaped curve for mortality related to A1C. An A1C of 7.5% was associated with the lowest mortality, with higher mortality seen at higher and lower A1C values.[31]

- CADTH Exec Summary: Within the limitations of available evidence, this report concludes:
  - Use of SMBG appears to be associated with improvements in glycemic control among patients with insulin-treated type 2 diabetes. Evidence was limited and of low quality.
  - Few studies compared different frequencies of SMBG for patients with either type 1 or insulin-treated type 2 diabetes, and the evidence from these studies was of low quality. Well-designed studies may prove beneficial in optimizing SMBG frequency for these individuals.
  - Use of SMBG in patients with type 2 diabetes who are not using insulin is associated with a statistically significant, albeit clinically modest, improvement in glycemic control. Performing SMBG may reduce the number of symptomatic hypoglycemic events in patients using sulfonylureas. There was little or no evidence that SMBG provides other benefits, such as improved quality of life, or greater patient satisfaction. Longer-term studies are needed to determine whether or not SMBG reduces diabetes related clinical endpoints (e.g., blindness, reduction in myocardial infarctions, end-stage renal disease) or mortality. Studies of specific subgroups within this population who may be more likely to benefit from SMBG are also warranted.
  - The effect of using SMBG in women with gestational diabetes requires further investigation.
- Estimated 40 year NNTs for SMBG in non-insulin T2DM: 266 for MI; 500 for stroke; 1,389 for end stage renal disease[15]

Comparison: CADTH & Canadian Diabetes Association (CDA).

- CADTH review includes detailed systematic review of the clinical evidence as well as cost evaluation. Significant effort goes into limiting, minimizing the possible effects of, and acknowledging conflicts of interest.
- CDA guidelines include clinical evidence only. Conflicts of interest are more extensive; however they are acknowledged.

Other Major Meta-analysis Reviews

- Poolsup et al SMBG Meta-analysis: suggests that SMBG in non-insulin T2DM may benefit those with a baseline A1C of >8%, but not < 8%.[32]
- St John meta-analysis: suggests similar ↓ in A1C of -0.22 (95% CI: -0.34—0.11). St John A, Davis WA, Price CP, Davis TM. The value of self-monitoring of blood glucose: a review of recent evidence. J Diabetes Complications. 2009 Feb 19.
- Gomes T, Juurlink DN, Shah BR, Paterson JM, Mamdani MM. Blood Glucose Test Strip Use: Patterns, Costs and Potential Cost Reduction Associated with Reduced Testing. ICES Investigative Report. Toronto: Institute for Clinical Evaluative Sciences; 2009. Accessed Feb 11, 2010 at http://www.ices.on.ca/file/Blood%20Glucose%20Test%20Strip_Dec2009.pdf Outlines strip costs for elderly in ON; found potential for reduce costs by $26 million - $302 million if less testing in low-risk.

Health Canada Related Alerts

- Possible interference of icodextrin, intravenous immunoglobulins, galactose and d-xylose with certain blood glucose meters - Notice to Hospitals http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/gluc_met_nth-aah-eng.php

Reagents: NOTE: (Adapted from Hamilton Family Health Team – Table)

Why consideration of reagants in test strips is important -e.g., peritoneal dialysis - use meters that are not affected by GDH-PQQ Rationale: drug products or therapies that contain certain non-glucose sugars, such as maltose, galactose, and xylose will produce falsely elevated glucose result if measuring your glucose using a GDH-PQQ test strip. This could result in insulin dosing errors or not detecting low (hypoglycemic) readings. Avoid use of these test strips in patients using interfering drug products or therapies. Glucose oxidase – may be important at certain altitudes, although very rare.

[A] Strips with glucose dehydrogenase (GDH) pyrroloquinolinequinone (PQQ) will have cross-reactivity with maltose, galactose or xylose but are unaffected by pO2.

[B] Strips with glucose oxidase are affected by pO2 in the blood but not by maltose, galactose and xylose

[C] Strips with glucose dehydrogenase (GDH) Flavin adenine dinucleotide (FAD) can be affected by xylose but unaffected by pO2, maltose and galactose.

Maltose: found in IV solutions (i.e. immunoglobulin) and other solutions containing dialysate icodextrin

Alternate site testing: not recommended if hypoglycemia suspected, especially if prone to hypoglycemic confusion. In these cases, the finger tip method is the best way to get an accurate result.

If practice changes to reflect the evidence, $450 million to $1.2 billion* could be freed up between 2012 and 2015 for spending on antidiabetes interventions that are proven effective. Patient health would not be affected negatively.

http://www.cadth.ca/media/compus/pdf/C1109-Prescribing-Aid-Web-e.pdf?&utm_source=c1109&utm_medium=vo2-issue-8&utm_campaign=communique-03-13-12 Revised March 2012

[These results were prepared using data from Brogan Inc., a unit of IMS, PharmaStat®, Public and Private Drug Plans Databases, 2000-2011]

- Cost to drug plans public+private = $330 million 2006 Canadian data
- Cost per QALY (quality adjusted life year) is estimated at $113,643 for routine use of SMBG (at least 1 strip each day on average).
- Annual cost per patient: $165 - $2,400 (see Table below).

Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. {From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.}

Rosenstock J, Zinman B, Murphy LJ, et al. **Inhaled insulin** improves glycemic control when substituted for or added to oral combination therapy in type 2 diabetes: a randomized, controlled trial. Ann Intern Med. 2005 Oct 18;143(8):549-58. CONCLUSIONS: Inhaled insulin improved overall glycemic control and hemoglobin A1c level when added to or substituted for dual oral agent therapy with an insulin secretagogue and sensitizer. Consistent with other insulin therapies, hypoglycemia and mild weight gain occurred. Pulmonary function showed no between-group differences.

25. van den Berghe G, Wouters P, Weekers F, Verwaest C, Bruyninckx F,et al. Intensive insulin therapy in the **critically ill patients**. N Engl J Med. 2001 Nov 8;345(19):1359-67.
26. Van den Berghe G, Wilmer A, Hermans G, et al. Intensive insulin therapy in the **medical ICU**. N Engl J Med. 2006 Feb 2;354(5):449-61. CONCLUSIONS: Intensive insulin therapy significantly reduced morbidity but not mortality among all patients in the medical ICU. Although the risk of subsequent death and disease was reduced in patients treated for three or more days, these patients could not be identified before therapy. Further studies are needed to confirm these preliminary data. (InfoPOEMs: Intensive insulin treatment of patients in the medical intensive care unit (ICU) is helpful if patients spend at least 3 days in the unit. Unfortunately, those with a shorter stay may be harmed, and physicians were unable to accurately predict who would actually stay 3 or more days (36% of those predicted to stay at least 3 days were discharged sooner in this study). (LOE = 1b))
27. Nathan DM, et al.; Diabetes Control and Complications Trial/Epidemiology of Diabetes Interventions and Complications (**DCCT/EDIC**) Study Research Group. Intensive diabetes treatment and cardiovascular disease in patients with type 1 diabetes. N Engl J Med. 2005 Dec 22;353(25):2643-53. (InfoPOEMs: This extension of the Diabetes Control and Complications Trial (DCCT) trial provides the first high-quality evidence that intensive treatment of Type 1 diabetes reduces the risk of adverse cardiovascular outcomes. Although the relative risk reduction was greater than 50%, the absolute risk reduction (0.42 per 100 patient years; NNT=25 over 10years) was modest. Note that this effect has not been shown in patients with Type 2 diabetes, although many patients and physicians believe otherwise, and data regarding all-cause mortality or adverse effects of intensive treatment (such as hypoglycemic episodes or traffic accidents) are not reported.. (LOE = 1b))

32. Hermansen K, et al. A 26-week, randomized, parallel, treat-to-target trial **comparing insulin detemir with NPH** insulin as add-on therapy to oral glucose-lowering drugs in insulin-naive people with type 2 diabetes. Diabetes Care. 2006 Jun;29(6):1269-74. In both groups, 70% of participants achieved an A1C < or =7.0%, but the proportion achieving this without hypoglycemia was higher with insulin detemir than with NPH insulin (26 vs. 16%, P = 0.008). Compared with NPH insulin, the risk for all hypoglycemia with insulin detemir was reduced by 47% (P < 0.001) and nocturnal hypoglycemia by 55% (P < 0.001). Mean weight gain was 1.2 kg with insulin detemir and 2.8 kg with NPH insulin (P < 0.001), and the difference in baseline-adjusted final weight was -1.58 (P < 0.001).

56. Holman RR, Thorne KI, Farmer AJ, Davies MJ, Keenan JF, Paul S, et al.; the **4-T Study** Group. Addition of Biphasic, Prandial, or Basal Insulin to Oral Therapy in Type 2 Diabetes. (4T) N Engl J Med. 2007 Sep 21; [Epub ahead of print] A single analogue-insulin formulation added to metformin and sulfonylurea resulted in a glycated hemoglobin level of 6.5% or less in a minority of patients at 1 year. The addition of biphasic or prandial insulin aspart reduced levels more than the addition of basal insulin detemir but were associated with greater risks of hypoglycemia and weight gain. (InfoPOEMs: Patients choosing biphasic or prandial insulin regiments should be prepared to gain approximately **10 pounds to 12 pounds** and expect **4 to 8 moderate or severe episodes of hypoglycemia per year**. Basal insulin was a bit less effective as measured by the change in glycated hemoglobin (Hb A1C), but resulted in less weight gain & much less hypoglycemia. Of course, we don't know whether any of these regiments improve long-term clinical outcomes in these patients. If you are going to add insulin for a patient with poorly controlled Type 2 diabetes, it makes sense to start with a single dose of basal insulin for most patients, and to focus primarily on those patients with an initial Hb A1C of more than 8.5%. (LOE = 1b))

    Holman, Rury R., Farmer, Andrew J., Davies, Melanie J., et al. the 4-T Study Group, **Three-Year** Efficacy of Complex Insulin Regimens in Type 2 Diabetes.N Engl J Med 2009 0: NEJMoa0905479. Patients who added a basal or prandial insulin-based regimen to oral therapy had better glycated hemoglobin control than patients who added a biphasic insulin-based regimen. Fewer hypoglycemic episodes and less weight gain occurred in patients adding basal insulin.

Lancet. 2008 Mar 29;371(9618):1073-84. A therapeutic regimen involving the addition of either basal or prandial insulin analogue is equally effective in lowering hae

TOP

A(1c). We conclude that insulin glargine provides a simple and effective option that is more satisfactory to patients than is lispro for early initiation of insulin therapy, since it was associated with a lower risk of hypoglycaemia, fewer injections, less blood glucose self monitoring, and greater patient satisfaction than was insulin lispro.

Epub 2008 Apr 29. Four subjects (Group 1) received the Edmonton immunosuppression regimen (daclizumab, sirolimus, tacrolimus). Six subjects (Group 2) received the University of Illinois protocol (etanercept, exenatide and the Edmonton regimen).Combined treatment of etanercept and exenatide improves islet graft function and facilitates achievement of insulin-independence with less islets.
74. Vardi M, Jacobson E, Nini A, Bitterman H. Intermediate acting versus long acting insulin for type 1 diabetes mellitus. Cochrane Database Syst Rev. 2008 Jul 16;(3):CD006297. Long acting insulin preparations seem to exert a beneficial effect on nocturnal glucose levels. Their effect on the overall diabetes control is clinically unremarkable. Their use as a basal insulin regimen for type 1 diabetes mellitus warrants further substantiation.
75. Rosenstock J, Davies M, Home PD, Larsen J, Koenen C, et al. A randomised, 52-week, treat-to-target trial comparing **insulin detemir with insulin glargine** when administered as add-on to glucose-lowering drugs in insulin-naive people with type 2 diabetes. Diabetologia. 2008 Jan 16; [Epub ahead of print] Supplementation of oral agents with detemir or glargine achieves clinically important improvements in glycaemic control with low risk of hypoglycaemia. Non-inferiority was demonstrated for detemir using higher insulin doses (mainly patients on twice daily dosing); weight gain was somewhat reduced with once daily insulin detemir.
76. Soylemez Wiener R, Wiener DC, Larson RJ. Benefits and risks of **tight glucose control in critically ill** adults: a meta-analysis. JAMA. 2008 Aug 27;300(8):933-44. In critically ill adult patients, tight glucose control is not associated with significantly reduced hospital mortality but is associated with an increased risk of hypoglycemia.
77. de Boer IH, Kestenbaum B, Rue TC, et al. Diabetes Control and Complications Trial (**DCCT**)/Epidemiology of Diabetes Interventions and Complications (**EDIC**) Study Research Group. Insulin therapy, hyperglycemia, and hypertension in type 1 diabetes mellitus. Arch Intern Med. 2008 Sep 22;168(17):1867-73. Hyperglycemia is a risk factor for incident hypertension in type 1 diabetes, and intensive insulin therapy reduces the long-term risk of developing hypertension.
78. Qayyum R, Bolen S, Maruthur N, et al. Systematic Review: Comparative Effectiveness and Safety of Premixed Insulin Analogues in Type 2 Diabetes. Ann Intern Med. 2008 Sep 15. [Epub ahead of print]

85. Arabi YM, Dabbagh OC, Tamim HM, et al. Intensive versus conventional insulin therapy: a randomized controlled trial in medical and surgical **critically ill patients**. Crit Care Med. 2008 Dec;36(12):3190-7. Intensive insulin therapy was not associated with improved survival among medical surgical intensive care unit patients and was associated with increased occurrence of hypoglycemia. Based on these results, we do not advocate universal application of intensive insulin therapy in intensive care unit patients.
86. Esposito K, Ciotola M, Maiorino MI, et al. Addition of neutral protamine lispro insulin or insulin glargine to oral type 2 diabetes regimens for patients with suboptimal glycemic control: a randomized trial. Ann Intern Med. 2008 Oct 21;149(8):531-9. Similar glycemic control occurred with the addition of NPL or glargine insulin to oral regimens in patients with poorly controlled type 2 diabetes. Hypoglycemia was similar in the 2 groups, but sample size limited the ability to make a definite safety assessment.
87. Hollander P, Cooper J, Bregnhøj J, Pedersen CB. A 52-week, multinational, open-label, parallel-group, noninferiority, treat-to-target trial comparing **insulin detemir with insulin glargine** in a basal-bolus regimen with mealtime insulin aspart in patients with type 2 diabetes. Clin Ther. 2008 Nov;30(11):1976-87. When used as indicated as part of a basal-bolus regimen in patients with T2DM who had previously received other insulin and/or OAD regimens, detemir was noninferior to glargine in its effects on overall glycemic control. Both basal insulins were associated with clinically relevant reductions in hyperglycemia. Both were well tolerated, with no significant difference in the frequency of hypoglycemia or AEs.

Malanda UL, Welschen LM, Riphagen II, et al. Self-monitoring of blood glucose in patients with type 2 diabetes mellitus who are not using insulin. Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.

Upcoming Trials in Diabetes/CV Risk Prevention:

- **NAVIGATOR** (Nateglinide and Valsartan in Impaired Glucose Tolerance Outcomes Research)- NEJM Mar/10; **TRANSCEND** (Telmisartan Randomized Assessment Study in aCE iNtolerant subjects with cardiovascular Disease); **RAPSODI** (rimonabant in diabetes prevention); **CANOE** (rosiglitazone 2mg bid & metformin 500mg bid in diabetes prevention);

Prediabetes [ADA]:

- Includes: 1) Impaired Fasting Glucose {8hr fasting BG between 5.6-6.9mmol/L) & 2) Impaired glucose tolerance {Postprandial BG of 7.8-11.0mmol/L 2hrs post 75g oral glucose challenge}
- Risk factors: family hx, obesity – especially around waist, age >45, hypertension, gestational diabetes hx, sedentary lifestyle. Screening recommendations vary; USPSTF recommends screening particularly if BP >135/80. Oral Glucose Challenge most recommended, but A1c screen also advocated by some.
- QDScore diabetes risk calculator: (UK Prediction Calculator for T2DM): http://www.qdscore.org/

Q&A: Limitations & Unanswered Questions Regarding A1C Control and Clinical Outcome - Benefits or Risks

There are some important qualifiers on the commonly quoted observational data that "with every 1 % drop in A1C the risk of developing long-term diabetes complications decreases". (Concept originally based on observational data driven by an eye related microvascular endpoint in the UKPDS). **RCT evidence does not support this assumption**!

- Most recently the **ACCORD** trial (established, higher risk T2DM) was halted after looking at whether a A1C target of <6% would result in beneficial clinical outcomes compared to 7-7.9%. According to the preliminary results still awaiting publication, it would appear from this RCT, in this population group, the extra 1.1% drop in A1C seen in the intensive group was actually associated with increased all cause death compared to the standard group. Explanations for this are still pending; some possibilities noted with 5yr follow-up discussion below.
  (See also; http://www.rxfiles.ca/rxfiles/uploads/documents/Diabetes-Targets-ACCORD-A1C.pdf).
  - 5 year ACCORD[7b] follow-up results published [Mar 2011 NEJM]: A1C lowering intensiveness relaxed for balance of study period; participants continued in BP or lipid lowering arms; A1C at 5 yrs ~ 7.2% vs 7.6%.
    1) ↑ death sustained in intensive glucose lowering group 5.5% vs 4.5% [NNH=100/5yr];
    2) ↓ non-fatal MI, but fatal CV ↑;
    3) severe hypoglycaemia equivalent in follow-up period;
    4) those most at risk of ↑ death were those with baseline A1C > 8%;
    5) possible explanations for harm with intensive glucose lowering:
    A) different outcomes associated with different drugs or drug combinations?: **B)** impact of ↑ wt gain?; **C)** impact of intense BG lowering.
- With the current RCT evidence with rosiglitazone, there is some concern that lowering A1C does not necessarily result in CV event reductions? With the limited evidence, it appears to at best be neutral, and at worst, harmful in RCTs/durations studied so far (e.g. up to 5.5 year RCTs.) Patients studied, agents used & study limitations [e.g. dropouts] may affect the benefit/risk balance.
- The UKPDS-33, ~ 10 year trial saw reductions predominantly in the microvascular events (predominantly photocoagulation), with stroke and heart related endpoints not significant, but trending favorably and contributing to the composite endpoint benefit. (Exception: metformin had all-cause death reduction in obese T2DM in UKPDS-34)
- In UKPDS 34,[p860] which noted a mortality benefit for metformin in obese T2DM, there is inconsistency in the association of A1C & outcomes (less A1C difference but more benefit [UKPDS34 VS 33])
- In UKPDS 34 Metformin + Sulfonylurea combination led to a lower A1C than Sulf alone (7.7 vs 8.2) but had higher incidence of DM death and all cause death (perhaps due to design issues and a several year delay in moving to combination therapy) .
- The UKPDS epidemiologic evidence for the 1% drop in A1C did not control for obesity/BMI/waist circumference. [UKPDS 35]
- In ADOPT, rosiglitazone decreased A1C more that metformin or glyburide, but glyburide had the lowest rate of CV outcomes.
- In VADT, a 1.5% reduction (6.9% [intensive] vs 8.4% [standard]) in A1C for an average follow-up of 5.6 years resulted in no benefit (microvascular or macrovascular) but increased serious adverse events (predominantly hypoglycaemia).

- **Meta-analysis [2011] of Intensive ↓ BG RCTs in T2DM**: 13 trials, n=34,500. Endpoints: mortality, no difference [(RR=1.04, 99%CI 0.91-1.19)]; CV death, no difference [(RR=1.11;0.86-1.43)]; non-fatal MI: ↓ (RR=0.85, [0.74-0.96]);
  Severe hypoglycaemia: ↑↑ (RR=2.33, [1.62-3.36]) 1.9-6.6% of patients required tx for severe hypoglycaemia over 5 years. If only high quality studies included, no longer a ↓ in non-fatal MI & there was an ↑ in HF.
  Microvascular effects: no difference, but heterogeneity; rate of retinopathy (0.85, 0.71-1.03); photocoagulation (0.91, 0.71-1.17), ↓ vision or blindness (1.00); neuropathy 0.99, 0.95-1.03); renal failure or 2x SCR (1.03, 0.98-1.08).
  Microalbuminuria: ↓ (0.90, 0.85-0.96), ARR 0.7%-3.1%; NNT=142-32. OVERALL: for hard clinical endpoints, no benefit, but increased severe hypoglycaemia requiring tx. However, note heterogeneity in trials, different tx approaches, different definitions of "intensive lowering", etc. Nevertheless, the more trials, the more evidence that just lowering BG does not equate automatically to beneficial clinical outcomes, but does carry hypoglycaemia risk.

There is some disconcordence between randomized trial outcome evidence and the frequently reported "1% A1C..." benefit. One thing that has growing certainty is that the risks and benefits of drug regimens that lower A1C is more complex than what was previously commonly accepted. While a high A1C is not good, some methods of lowering A1C in some patient groups, are also harmful. While we do not want to be lazy in addressing glucose control, the evidence suggests that we not assume a net benefit for all A1C lowering interventions in all Type 2 diabetes patients. {*Let the target serve the patient, and not the patient the target.*}

Hemmingsen B, Lund SS, Gluud C, et al. Targeting intensive glycaemic control versus targeting conventional glycaemic control for type 2 diabetes mellitus. Cochrane Database of Systematic Reviews 2011, Issue 6. Art. No.: CD008143. DOI: 10.1002/14651858.CD008143.pub2. The included trials did not show significant differences for all-cause mortality and cardiovascular mortality when targeting intensive glycaemic control compared with conventional glycaemic control. Targeting intensive glycaemic control reduced the risk of microvascular complications while increasing the risk of hypoglycaemia. Furthermore, intensive glycaemic control might reduce the risk of non-fatal myocardial infarction in trials exclusively dealing with glycaemic control in usual care settings.

[12] Rosenstock J, Davies M, Home PD, Larsen J, Koenen C, Schernthaner G. A randomised, 52-week, treat-to-target trial comparing insulin detemir with insulin glargine when administered as add-on to glucose-lowering drugs in insulin-naive people with type 2 diabetes. Diabetologia. 2008 Mar;51(3):408-16. {582 patients were randomly assigned to supplemental OD detemir (55% went on to require BID dosing) or OD glargine. Improvement in A1c and rates of hypoglycaemia were similar, but OD detemir had less weight gain than glargine (1.6kg difference). In those patients who required BID detemir: the benefit of decreased weight gain was lost and a higher daily dose was required. Average daily dose required was: glargine od 0.4 unit/kg, detemir od 0.52 unit/kg & detemir bid 1 unit/kg (Overall average detemir dose 0.78 unit/kg). More discontinuations occurred due to injection site reactions with detemir (4.5% vs 1.4%.}

FDA Aug/09 Patients with diabetes who take therapeutic products containing nonglucose sugars (e.g., peritoneal dialysis solution and some immunoglobulins) can have falsely elevated readings from blood glucose test strips that use glucose dehydrogenase pyrroloquinoline quinone (GDH-PQQ) technology, according to an FDA public health notification. The strips are in wide use, and we have provided a link to a listing of the affected products. The FDA cites 13 deaths associated with hypoglycemia not detected by the test strips, which cannot distinguish between lucose and other sugars such as maltose and xylose. Ten patients were receiving icodextrin peritoneal dialysis solution. The FDA advises physicians to avoid using GDH-PQQ test strips in health care facilities and to rely, instead, on laboratory assays of glucose — especially in patients taking the therapeutic products listed in the alert. Interfering products containing nonglucose sugars include icodextrin peritoneal dialysis solution, certain immunoglobulins, abatacept (Orencia, Bristol-Myers Squibb), tositumomab (Bexxar, GlaxoSmithKline), and any product containing or metabolized into maltose, galactose, or xylose. Several test strips and associated monitors use GDH-PQQ methodology: *ACCU-CHEK* (Roche), *FreeStyle* (Abbott Diabetes Care), *TRUEtest* (Home Diagnostics), *CoZmonitor* blood glucose module (for use with the *Deltec Cozmo* insulin pump, Smiths Medical MD), and *OmniPod* insulin management system (Insulet).

Holman RR, Thorne KI, Farmer AJ, Davies MJ, Keenan JF, Paul S, et al.; the 4-T Study Group. Addition of Biphasic, Prandial, or Basal Insulin to Oral Therapy in Type 2 Diabetes. (4T) N Engl J Med. 2007 Sep 21; [Epub ahead of print] A single analogue-insulin formulation added to metformin and sulfonylurea resulted in a glycated hemoglobin level of 6.5% or less in a minority of patients at 1 year. The addition of biphasic or prandial insulin aspart reduced levels more than the addition of basal insulin detemir but were associated with greater risks of hypoglycemia and weight gain. (InfoPOEMs: Patients choosing biphasic or prandial insulin regiments should be prepared to gain approximately 10 pounds to 12 pounds and expect 4 to 8 moderate or severe episodes of hypoglycemia per year. Basal insulin was a bit less effective as measured by the change in glycated hemoglobin (Hb A1C), but resulted in less weight gain & much less hypoglycemia. Of course, we don't know whether any of these regiments improve long-term clinical outcomes in these patients. If you are going to add insulin for a patient with poorly controlled Type 2 diabetes, it makes sense to start with a single dose of basal insulin for most patients, and to focus primarily on those patients with an initial Hb A1C of more than 8.5%. (LOE = 1b))

Holman, Rury R., Farmer, Andrew J., Davies, Melanie J., et al. the 4-T Study Group, Three-Year Efficacy of Complex Insulin Regimens in Type 2 Diabetes.N Engl J Med 2009 0: NEJMoa0905479. Patients who added a basal or prandial insulin-based regimen to oral therapy had better glycated hemoglobin control than patients who added a biphasic insulin-based regimen. Fewer hypoglycemic episodes and less weight gain occurred in patients adding basal insulin.

Malanda UL, Welschen LM, Riphagen II, et al. Self-monitoring of blood glucose in patients with type 2 diabetes mellitus who are not using insulin. Cochrane Database Syst Rev. 2012 Jan 18;1:CD005060. From this review, we conclude that when diabetes duration is over one year, the overall effect of self-monitoring of blood glucose on glycaemic control in patients with type 2 diabetes who are not using insulin is small up to six months after initiation and subsides after 12 months. Furthermore, based on a best-evidence synthesis, there is no evidence that SMBG affects patient satisfaction, general well-being or general health-related quality of life. More research is needed to explore the psychological impact of SMBG and its impact on diabetes specific quality of life and well-being, as well as the impact of SMBG on hypoglycaemia and diabetic complications.

Extras

- ASCEND (A Study of Cardiovascular Events iN Diabetes) and ACCEPT-D (Aspirin and Simvastatin Combination for Cardiovascular Events Prevention Trial in Diabetes). These are large, ongoing studies that will enrol up to 15,000 participants with anticipated completion dates of 2011 and 2013, respectively.

ETDRS 5 yrs, n=3,711	T1DM & T2DM plus diabetic retinopathy; ~50% of pts with hx of CV disease <10% hx of MI or stroke	aspirin 2 x 325mg/day vs placebo	◆ 1°: all-cause mortality, 12.1 vs 14.9, RR 0.91 [99% CI, 0.75 to 1.11, p=0.24] ◆ 2°: cardiovascular mortality, 9.3 vs 11.2, RR 0.87 [99% CI, 0.7 to 1.1, p=0.12] ◆ 2°: fatal or non-fatal MI, 9.1 vs 12.3, RR 0.83 [99% CI, 0.66 to 1.04] ◆ 2°: fatal or non-fatal stroke, 4.5 vs 3.8, RR 1.17 [99% CI, 0.79 to 1.28] -no evidence of harmful effects of aspirin

ETDRS Investigators. Aspirin effects on mortality and morbidity in patients with diabetes mellitus. Early Treatment Diabetic Retinopathy Study Report 14. *JAMA* 1992; 268(10); 1292-1300.

TOP

- From Circulation 2010: Intervention patients experienced a decreased risk of nonfatal or fatal MI (RR 0.85, 95% CI 0.73–1.00). In contrast, stroke occurred more frequently with aspirin, although the difference was not statistically significant (RR 1.18, 99% CI 0.88 –1.58). Men appeared to derive more benefit from aspirin than women for prevention of MI (RR for men 0.74, 99% CI 0.54 –1.00; RR for women 0.91, 99% CI 0.65–1.28), but this difference was not statistically significant and could represent a chance finding.
- From CCS 2011: For the predetermined secondary endpoint of fatal or nonfatal MI, the difference was significant at 5 years (RR 0.72, 99% CI 0.55-0.95) but not at 7 years (RR 0.83, 99% CI 0.66-1.04).

[3] Li Z, Maglione M, Tu W, Mojica W,et al. Meta-analysis: pharmacologic treatment of **obesity**. Ann Intern Med. 2005 Apr 5;142(7):532-46. CONCLUSIONS: Sibutramine, orlistat, phentermine, probably diethylpropion, bupropion, probably fluoxetine, and topiramate promote modest weight loss when given along with recommendations for diet. Sibutramine and orlistat are the 2 most-studied drugs. (InfoPOEMs: On the basis of flimsy evidence of benefit, The American College of Physicians recommends drug therapy for the treatment of obesity. They also recommend gastric bypass surgery, performed by an experienced surgeon, for patients with marked obesity and other risk factors for premature death. (LOE = 5))

[5] Padwal R, Li SK, Lau DC. Long-term pharmacotherapy for obesity and overweight. **Cochrane** Database Syst Rev. 2004;(3):CD004094. REVIEWERS' CONCLUSIONS: Studies evaluating the long-term efficacy of anti-obesity agents are limited to orlistat and sibutramine. Both drugs appear modestly effective in promoting weight loss; however, interpretation is limited by high attrition rates. Longer and more methodologically rigorous studies of anti- obesity drugs that are powered to examine endpoints such as mortality and cardiovascular morbidity are required to fully evaluate any potential benefit of such agents.

[12] Saenz A, Fernandez-Esteban I, Mataix A, et al. Metformin monotherapy for type 2 diabetes mellitus. **Cochrane** Database Syst Rev. 2005 Jul 20;(3):CD002966. CONCLUSIONS: Metformin may be the first therapeutic option in the diabetes mellitus type 2 with overweight or obesity, as it may prevent some vascular complications, and mortality. Metformin produces beneficial changes in glycaemia control, and moderated in weight, lipids, insulinaemia and diastolic blood pressure. Sulphonylureas, alpha-glucosidase inhibitors, thiazolidinediones, meglitinides, insulin, and diet fail to show more benefit for glycaemia control, body weight, or lipids, than metformin.

[14] Despres, JP, Golay A, Sjostrom L. Effects of **rimonabant** on metabolic risk factors in overweight patients with dyslipidemia (**Rio-Lipids**). N Engl J Med 2005;353:2121-34. (Weight loss: 6.7kg at 1yr by repeated-measures method)
Pi-Sunyer FX, et al. RIO-North America Study Group. Effect of **rimonabant**, a cannabinoid-1 receptor blocker, on weight and cardiometabolic risk factors in overweight or obese patients: **RIO-North America**: a randomized controlled trial. JAMA. 2006 Feb 15;295(7):761-75. In this multicenter trial, treatment with 20 mg/d of rimonabant plus diet for **2 years** promoted modest but sustained reductions in weight and waist circumference and favorable changes in cardiometabolic risk factors. {InfoPOEMs: Rimonabant (Acomplia) is minimally effective for obese or overweight patients for achieving sustained weight loss. Less than half the subjects initially enrolled in this study completed the protocol at 1 year. Of those remaining in the study, only one fourth lost a clinically significant amount of weight (10% or more) and, as with other weight-loss drugs, the patients who stopped taking the medicine after 1 year regained the weight. (LOE = 1b-)
Van Gaal LF, Rissanen AM, Scheen AJ, et al. **RIO-Europe** Study Group. Effects of the cannabinoid-1 receptor blocker **rimonabant** on weight reduction and cardiovascular risk factors in overweight patients: 1-year experience from the RIO-Europe study. Lancet. 2005 Apr 16-22;365(9468):1389-97. Erratum in: Lancet. 2005 Jul 30-Aug 5;366(9483):370. (n=1507, weight loss at 1 year: placebo -1.8kg (±6.4), rimonabant 5mg/d -3.4kg (±5.7), rimonabant 20mg/d -6.6kg (±7.2) (p<0.001). {Medscape article on rimonabant in RIO-Diabetes: http://www.medscape.com/viewarticle/546739_print}
Christensen R, Kristensen PK, Bartels EM, Bliddal H, Astrup A. Efficacy and safety of the weight-loss drug rimonabant: a meta-analysis of randomised trials. Lancet. 2007 Nov 17;370(9600):1706-13. Our findings suggest that 20 mg per day rimonabant increases the risk of **psychiatric adverse events**--ie, depressed mood disorders and anxiety-despite depressed mood being an exclusion criterion in these trials. Taken together with the recent US Food and Drug Administration finding of increased risk of suicide during treatment with rimonabant, we recommend increased alertness by physicians to these potentially severe psychiatric adverse reactions. { InfoPOEMs Jan08: These authors searched several databases for double-blind randomized trials of rimonabant for weight loss in patients with a body mass index higher than 30 (27 if the patient also had an obesity-related comorbid condition such as diabetes). Two reviewers independently assessed the quality of the included studies using the Jadad score. The authors don't describe looking for unpublished studies. Four trials (4105 patients) were included in this analysis. After 1 year, patients taking rimonabant lost an average of 4.7 kg more than did those given placebo. Additionally, 25% of patients taking rimonabant lost at least 10% of their baseline weight compared with 7% of control patients (number needed to treat = 5.3; 95% CI, 4.8 - 6). However, patients taking rimonabant were more likely to have unspecified serious adverse events (4% vs 6%; number needed to treat to harm [NNTH] = 58; 95% CI, 33 - 295). Additionally, 3% of patients taking rimonabant developed depression compared with 1.4% of control patients (NNTH = 63; 95% CI, 41-150). Although it's not formally addressed in this study, the authors mention recent Food and Drug Administration reports of increased suicide risk in patients taking rimonabant.}

[39] Sjostrom L, Narbro K, Sjostrom CD, et al.; Swedish Obese Subjects Study (**SOS**). Effects of **bariatric surgery** on mortality in Swedish obese subjects. N Engl J Med. 2007 Aug 23;357(8):741-52. Bariatric surgery for severe obesity is associated with long-term weight loss and decreased overall mortality.

Sjostrom L, et al.; Swedish Obese Subjects (**SOS**) Study Scientific Group. Lifestyle, diabetes, and cardiovascular risk factors 10 years after bariatric surgery. N Engl J Med. 2004 Dec 23;351(26):2683-93. After two years, the weight had increased by 0.1 percent in the control group and had decreased by 23.4 percent in the surgery group (P<0.001). After 10 years, the weight had increased by 1.6 percent and decreased by 16.1 percent, respectively (P<0.001). Energy intake was lower and the proportion of physically active subjects higher in the surgery group than in the control group throughout the observation period. Two- and 10-year rates of recovery from diabetes, hypertriglyceridemia, low levels of high-density lipoprotein cholesterol, hypertension, and hyperuricemia were more favorable in the surgery group than in the control group, whereas recovery from hypercholesterolemia did not differ between the groups. The surgery group had lower 2- and 10-year incidence rates of diabetes, hypertriglyceridemia, and hyperuricemia than the control group; differences between the groups in the incidence of hypercholesterolemia and hypertension were undetectable.

Alley DE, Chang VW. The changing relationship of **obesity and disability**, 1988-2004. JAMA. 2007 Nov 7;298(17):2020-7. Recent cardiovascular improvements have not been accompanied by reduced disability within the obese older population. Rather, obese participants surveyed during 1999-2004 were more likely to report functional impairments than obese participants surveyed during 1988-1994, and reductions in ADL impairment observed for nonobese older individuals did not occur in those who were obese. Over time, declines in obesity-related mortality, along with a younger age at onset of obesity, could lead to an increased burden of disability within the obese older population.

Curioni C, Andre C. **Rimonabant** for overweight or obesity. Cochrane Database Syst Rev. 2006 Oct 18;(4):CD006162. Compared with placebo, rimonabant 20 mg produced a 4.9 kg greater reduction in body weight in trials with one-year results. The use of rimonabant after one year produces modest weight loss of approximately 5%. Even modest amounts of weight loss may be potentially beneficial. The observed results should be interpreted with some caution, though, since the evaluated studies presented some deficiencies in methodological quality. Studies with longer follow-ups after the end of treatment and of more rigorous quality should be done before definitive recommendations can be made regarding the role of this new medication in the management of overweight or obese patients.

Faulkner G, Cohn TA. Pharmacologic and nonpharmacologic strategies for weight gain and metabolic disturbance in patients treated with **antipsychotic** medications. Can J Psychiatry. 2006 Jul;51(8):502-11. Review. Erratum in: Can J Psychiatry. 2006 Aug;51(9):620. Although difficult, the prevention of weight gain and the promotion of weight loss are possible for individuals treated with antipsychotic medications. Further research, including diabetes prevention studies, is required. We suggest a pathway for the management of weight gain and emerging metabolic disturbance.

FDA approves **Orlistat for OTC**, Pharmacist's Letter Mar 2007.

FDA Nov/08 Fashion Sanctuary announced a recall of **Zhen De Shou Fat Loss** Capsules because FDA analysis found the product to contain undeclared sibutramine, an FDA approved drug used as an appetite suppressant for weight loss.

FDA Jan/09 notified consumers not to take Venom **HYPERDRIVE 3.0**, a product sold as a dietary supplement but containing sibutramine.

FDA Mar/09 Herbal **Xenicol** (found to contain cetilistat, an obesity drug not approved in the U.S.) along with **Slimbionic** and **Xsvelten** (both containing sibutramine, a prescription-only weight loss drug) have been added to the list of tainted dietary supplements. There are now **72 products** on the list. http://www.fda.gov/bbs/topics/NEWS/2009/NEW01977.html

FDA Apr/09: **ABC Beauty Supply** & FDA notified consumers and healthcare professionals of a recall of 34 dietary supplement products. FDA lab analyses identified undeclared **sibutramine**, an FDA- approved drug, used as an appetite suppressant for weight loss. http://www.fda.gov/oc/po/firmrecalls/universalabc04_09.html **(34 products listed)**

FDA July/09 notified healthcare professionals that four weight loss dietary supplements sold and marketed by the firm (**Slimbionic, One Weight Loss Pill, SlimDemand Capsules, Botanical Weight Loss**) contain sibutramine.

FDA Aug/09 notified healthcare professionals and patients that it is reviewing new safety information regarding reports of liver-related adverse events in patients taking orlistat. **Orlistat** is marketed in the United States as a prescription product, Xenical, and as an over-the-counter (OTC) product, Alli. Between 1999 and October 2008, 32 reports of serious liver injury, including **6 cases of liver failure**, in patients using orlistat were submitted to FDA's Adverse Event Reporting System. The most commonly reported adverse events described in the 32 reports of serious liver injury were jaundice, weakness, and abdominal pain.

FDA Nov/09 & GMP Herbal Products notified consumers and healthcare professionals of a recall of **Pai You Guo**, a weight loss dietary supplement, due to the presence sibutramine & phenolphthalein **.**

FDA Jan/10 notified consumers and healthcare professionals about a counterfeit and potentially harmful version of **Alli 60 mg capsules** (120 count refill kit). The **counterfeit** version contained the controlled substance sibutramine and did not contain orlistat, the active ingredient.

FDA July/10 analysis of **Que She** found that it contains: fenfluramine – a stimulant drug withdrawn from the U.S. market in 1997 after studies demonstrated that it caused serious heart valve damage, propranolol – a prescription beta blocker drug that can pose a risk to people with bronchial asthma and certain heart conditions, sibutramine – a controlled substance and prescription weight loss drug, sibutramine was the subject of a recent study whose preliminary findings showed an association between sibutramine use and increased risk of heart attack and stroke in patients who have a history of heart disease, & ephedrine – a stimulant drug that is legally marketed over-the-counter for temporary relief of asthma but can pose a risk to people with certain cardiovascular conditions.

FDA Aug/10 lab analysis of **Solo Slim** was found to contain the undeclared drug ingredient Didesmethyl Sibutramine.

FDA July/10 lab analysis of **Slim-30** Herb Supplement distributed by the company was found to contain undeclared N-Desmethyl Sibutramine and traces of Sibutramine.

Health Canada Feb/11 is advising consumers not to use the following foreign health products due to concerns about possible adverse reactions: **1. Fruta Planta, Reduce Weight Fruta Planta** The U.S. FDA warned consumers not to buy or use Fruta Planta and Reduce Weight Fruta Planta after FDA lab tests revealed that this product contains undeclared sibutramine. **2. Slimming Factor** The Australian TGA warned consumers not to buy or use Slimming Factor after TGA lab tests confirmed the presence of the undeclared substances sibutramine, fenfluramine and phenolphthalein. According to the TGA release, the product is sold over the Internet.

Health Canada Mar/11 is advising consumers not to use the following foreign health products due to concerns about possible adverse reactions: 1. **Celerite Slimming Capsules**: The U.S. FDA informed consumers of a company recall of CeleriteTM Slimming Capsules after it was found to contain undeclared sibutramine. 2. **Herbal Flos Lonicerae** (Herbal Xenicol) Natural Weight Loss Formula: The product was found to contain undeclared sibutramine at more than twice the dose that was normally prescribed before sibutramine was removed from the UK market in 2010.

Health Canada May/11 is advising consumers not to use the following foreign health products due to concerns about possible adverse reactions: **1. Dr. Health Series CM Factor** The Hong Kong Department of Health warned consumers not to buy or use this product after it was found to contain an unauthorized substance similar to sibutramine that may pose similar health risks.

Health Canada July/11 is advising consumers not to use the following foreign health products due to concerns about possible adverse reactions: **1. Slim Xtreme Herbal Slimming Capsules** The U.S. Food and Drug Administration informed consumers of a voluntary recall after *Slim Xtreme Herbal Slimming Capsules* was found to contain undeclared sibutramine.

Health Canada Aug/11 is advising consumers not to use the following foreign health products due to concerns about possible adverse reactions: **1. Celerite Slimming Tea** The U.S. FDA informed consumers of a company recall of Celerite Slimming Tea after it was found to contain undeclared sibutramine. **2. Pink Lady for Women Capsules, St Nirvana Herbal Slimming Capsules** The Australian TGA warned consumers not to use these products after Pink Lady for Women Capsules was found to contain undeclared tadalafil while St Nirvana Herbal Slimming Capsules was found to contain undeclared sibutramine and phenolphthalein. According to the TGA advisories, these products are sold over the Internet. **3. Fifteen products promoted for weight loss** The Hong Kong Department of Health (HKDH) warned consumers not to buy or use these 15 products after they were found to contain at least one of the following undeclared substances: phenolphthalein, sibutramine, and/or an unauthorized substance similar to sibutramine.

Health Canada Oct/11 is advising Canadians not to use these foreign health products as they may pose a health risk. **Slim Forte Slimming Capsules**, **Slim Forte Double Power Slimming Capsules**, **Slim Forte Slimming Coffee** and **Meizitang Botanical Slimming Soft Gel**-The U.S. Food and Drug Administration warned that these weight loss products contain an unauthorized drug (sibutramine). **OxyELITE Pro capsules and Pure Fat Three Days Reduce Weight capsules**-The Australian Therapeutic Goods Administration warned that these weight loss products contain an unauthorized drug (sibutramine), or a prescription drug (yohimbine).

Health Canada Nov/11 is advising Canadians not to use these foreign health products as they may pose a health risk. 1. **Metabolic Advantage** The Singapore Health Sciences Authority warned that this weight-loss product contains prescription drugs (thyroid hormones). 2. **Tian Ma Tu Chung Seven Leave Ginseng, Vall-Boon Tongkat Al,** and **Pao Ni Kang** The Singapore Health Sciences Authority warned that these traditional herbal products contain prescription and over-the-counter drugs (dexamethasone, ketoconazole, repaglinide, pheniramine, and chlorpheniramine). 3. **Slimming Kapsul** The Hong Kong Department of Health warned that this weight-loss product contains an unauthorized drug (sibutramine) and a prescription drug (spironolactone). 4. **Pancre-Plus** The Hong Kong Department of Health warned that this counterfeit Chinese medicine contains an unauthorized drug (phenformin) and a prescription drug (glyburide).

Health Canada Jan/12 advises: 1)**17 weight loss products (see Alert for a complete list)** A-Slim 100% Natural Slimming Capsule, Acai Berry Soft Gel ABC, Advanced Slim 5 >DaiDaiHuaJiaoNang, Dream Body Slimming Capsule, Fruit Plant Lossing Fat Capsule, Health Slimming Coffee, Ja Dera 100% Natural Weight Loss Supplement, Leisure 18 Slimming Coffee, Lishou, Magic Slim Tea, Magic Slim Weight Reduction Capsule, P57 Hoodia, Pai You Guo Slim Tea, PhentraBurn Slimming Capsules, Slender Slim 11 Tengda. The U.S. Food and Drug Administration warned that these weight loss products contain unauthorized drugs (sibutramine, phenolphthalein). **2. Slimina weightloss capsules, S-shape slim capsules** The Australian Therapeutic Goods Administration warned that these weight loss products contain prescription drugs (propranolol, nifedipine) and/or unauthorized drugs (sibutramine, fenfluramine, phenolphthalein). **3. Cardiotium, Paidusu, SlimEasy Herbs Capsule, Tianran Zuanshi Xianweisu** The Hong Kong Department of Health warned that these health products contain prescription drugs (losartan, atorvastatin, thyroxine) and/or unauthorized drugs (sibutramine, phenolphthalein).

Health Canada May/12 1. **CanSui; Lexscl Fat Rapid Loss Capsule; The Extreme-thin Fat Burning Bomb; Xiu Zhi Su L-Carnitine Slimming Capsule** The Hong Kong Department of Health warned that these weight loss products contain unauthorized drugs (sibutramine, phenolphthalein). 2. **Lipro Diet Pills; Xiyouji Qingzhi** weight loss capsules The Australian Therapeutic Goods Administration warned that these weight loss products contain an unauthorized drug (sibutramine).

Health Canada June/12 **1. Japan Weight Loss Blue, Japan Rapid Weight Loss Diet Pills Green; Japan Rapid Weight Loss Diet Pills Yellow:** The U.S. Food and Drug Administration warned that these weight loss products contain prescription drugs (sibutramine, ephedrine alkaloids) and unauthorized drugs (phenolphthalein, and substances similar to sibutramine). **2. Mince Belle; Everlax; Ever Slim; Ever Slim Shake Mix (Strawberry); Ever Slim Shake Mix (Chocolate); Acai-Man Mangosteen Herbal Drink; Perfect Men:** The U.S. Food and Drug Administration informed of a recall because these weight loss and sexual enhancement products contain prescription drugs (sibutramine or tadalafil).

Ogden CL, Carroll MD, Flegal KM. High body mass index for age among **US children and adolescents, 2003-2006**. JAMA. 2008 May 28;299(20):2401-5. The prevalence of high BMI for age among children and adolescents showed no significant changes between 2003-2004 and 2005-2006 and no significant trends between 1999 and 2006.
Ogden CL, Carroll MD, Curtin LR, McDowell MA, Tabak CJ, Flegal KM. **Prevalence** of overweight and obesity in the **United States, 1999-2004**. JAMA. 2006 Apr 5;295(13):1549-55. The prevalence of overweight among children and adolescents and obesity among men increased significantly during the 6-year period from 1999 to 2004; among women, no overall increases in the prevalence of obesity were observed. These estimates were based on a 6-year period and suggest that the increases in body weight are continuing in men and in children and adolescents while they may be leveling off in women.

Oude Luttikhuis H, Baur L, Jansen H, Shrewsbury VA, O'Malley C, Stolk RP, Summerbell CD. Interventions for treating **obesity in children. Cochrane** Database Syst Rev. 2009 Jan 21;(1):CD001872. While there is limited quality data to recommend one treatment program to be favoured over another, this review shows that combined behavioural lifestyle interventions compared to standard care or self-help can produce a significant and clinically meaningful reduction in overweight in children and adolescents. In obese adolescents, consideration should be given to the use of either orlistat or sibutramine, as an adjunct to lifestyle interventions, although this approach needs to be carefully weighed up against the potential for adverse effects.

Preganancy: May/09 Obese women (BMI, 30 or higher) should gain only 11 to 20 pounds during a singleton pregnancy, according to new guidelines from the Institute of Medicine. The guidelines update the IOM's previous recommendations, issued in 1990. The group continues to recommend that: underweight women (BMI lower than 18.5) gain 28-40 pounds; normal-weight women (BMI, 18.5-24.9) gain 25-35 pounds; overweight women (BMI, 25.0-29.9) gain 15-25 pounds. Weight gain should be higher for multiple pregnancies. Excessive weight gain, the IOM notes, is associated with increased risk for gestational diabetes, pregnancy-associated hypertension, and delivery of large-for-gestational-age infants, among other outcomes. The group says that clinicians should supplement these guidelines with individualized counseling about diet and exercise. In addition, preconception counseling should stress the importance of conceiving at a normal BMI. http://www.iom.edu/Object.File/Master/68/110/Report%20Brief%20-%20Weight%20Gain%20During%20Pregnancy.pdf

BMJ. 2007 Dec 1;335(7630):1134. Epub 2007 Nov 6. Increasing body mass index is associated with a significant increase in the risk of cancer for 10 out of 17 specific types examined. Among postmenopausal women in the UK, 5% of all cancers (about 6000 annually) are attributable to being overweight or obese. For endometrial cancer and adenocarcinoma of the oesophagus, body mass index represents a major modifiable risk factor; about half of all cases in postmenopausal women are attributable to overweight or obesity.

Rucker D, Padwal R, Li SK, Curioni C, Lau DC. Long term **pharmacotherapy** for obesity and overweight: **updated meta-analysis**. BMJ. 2007 Nov 15; [Epub ahead of print] Attrition rates averaged 30-40%. Compared with placebo, orlistat reduced weight by 2.9 kg (95% confidence interval 2.5 kg to 3.2 kg), sibutramine by 4.2 kg (3.6 kg to 4.7 kg), and rimonabant by 4.7 kg (4.1 kg to 5.3 kg). Patients receiving active drug treatment were significantly more likely to achieve 5% and 10% weight loss thresholds. Orlistat reduced the incidence of diabetes and improved concentrations of total cholesterol and low density lipoprotein cholesterol, blood pressure, and glycaemic control in patients with diabetes but increased rates of gastrointestinal side effects and slightly lowered concentrations of high density lipoprotein. Sibutramine lowered concentrations of high density lipoprotein cholesterol and triglycerides but raised blood pressure and pulse rate. Rimonabant improved concentrations of high density lipoprotein cholesterol and triglycerides, blood pressure, and glycaemic control in patients with diabetes but increased the risk of mood disorders. Orlistat, sibutramine, and rimonabant modestly reduce weight, have differing effects on cardiovascular risk profiles, and have specific adverse effects.

Sjostrom L, et al.; Swedish Obese Subjects (**SOS**) Study Scientific Group. Lifestyle, diabetes, and cardiovascular risk factors 10 years after bariatric surgery. N Engl J Med. 2004 Dec 23;351(26):2683-93. After two years, the weight had increased by 0.1 percent in the control group and had decreased by 23.4 percent in the surgery group (P<0.001). After 10 years, the weight had increased by 1.6 percent and decreased by 16.1 percent, respectively (P<0.001). Energy intake was lower and the proportion of physically active subjects higher in the surgery group than in the control group throughout the observation period. Two- and 10-year rates of recovery from diabetes, hypertriglyceridemia, low levels of high-density lipoprotein cholesterol, hypertension, and hyperuricemia were more favorable in the surgery group than in the control group, whereas recovery from hypercholesterolemia did not differ between the groups. The surgery group had lower 2- and 10-year incidence rates of diabetes, hypertriglyceridemia, and hyperuricemia than the control group; differences between the groups in the incidence of hypercholesterolemia and hypertension were undetectable.

Some food groups in the Mediterranean diet are more important than others in promoting health and longer life, according to this prospective cohort study from the Greek segment of the European Prospective Investigation into Cancer and nutrition (EPIC). The researchers investigated the importance of individual components of the diet and found that eating more vegetables, fruits, nuts, pulses, and olive oil, and drinking moderate amounts of alcohol is linked to people living longer, whereas following a Mediterranean diet high in seafood and cereals and low in dairy products was not an indicator of longevity.

Energy Drinks	**Health Canada: Safe Use of Energy Drinks.** Accessed online at http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/food-aliment/boissons-energ-drinks-eng.php. {Excessive drinking of energy drinks or mixing them with alcohol can have serious health effects. Energy drinks are meant to supply mental and physical stimulation for a short period of time. They usually contain caffeine, taurine (an amino acid, one of the building blocks of protein), vitamins and glucuronolactone, a carbohydrate. Energy drinks should not be confused with sports drinks such as Gatorade® or Powerade®. Sports drinks re-hydrate the body and provide sugars, which the body burns to create energy and replenish electrolytes.}
Glucomannan (in PGX PolyGlycopleX)	Plant fibre water-soluble: unabsorbable polysaccharide (glucose + mannose). May ↓LDL, ↓gastric emptying & improve BG control. Conflicting evidence. SE: gas, bloating, etc.

FDA Dec/08 alerted consumers nationwide not to purchase or consume more than **25 different products** marketed for weight loss because they contain undeclared, active pharmaceutical ingredients that may put consumers' health at risk. The undeclared active pharmaceutical ingredients in some of these products include sibutramine (a controlled substance), rimonabant (a drug not approved for marketing in the United States), phenytoin (an anti-seizure medication), and phenolphthalein (a solution used in chemical experiments and a suspected cancer causing agent). The weight loss products, some of which are marked as "dietary supplements," are promoted and sold on various web sites and in some retail stores. FDA advises consumers who use the products to stop taking them and consult their healthcare professional immediately as the health risks posed by these products can be serious (for

TOP

example, high blood pressure, seizures, tachycardia, palpitations, heart attack or stroke). FDA also encourages consumers to seek guidance from healthcare professional before purchasing weight loss products. See the FDA News Release for a listing of the names of the 25 referenced products. Read the MedWatch 2008 safety summary, including links to http://www.fda.gov/medwatch/safety/2008/safety08.htm#Weight

FDA May/09 warned consumers to immediately stop using **Hydroxycut products by Iovate Health Sciences**, Inc. Hydroxycut products are associated with a number of **serious liver injuries**. Hydroxycut products are dietary supplements that are marketed for weight-loss, as fat burners, as energy-enhancers, as low carb diet aids, and for water loss under the Iovate and MuscleTech brand names. FDA has received 23 reports of serious health problems ranging from jaundice and elevated liver enzymes, an indicator of potential liver injury, to liver damage requiring liver transplant. One death due to liver failure has been reported to FDA. Other health problems reported include seizures; cardiovascular disorders; and rhabdomyolysis, a type of muscle damage that can lead to other serious health problems such as kidney failure.

FDA Jan/10 notified consumers and healthcare professionals about a counterfeit and potentially harmful version of **Alli 60 mg capsules** (120 count refill kit). The **counterfeit version** contained the controlled substance sibutramine and did not contain orlistat, the active ingredient.

FDA July/10 analysis of **Que She** found that it contains: fenfluramine – a stimulant drug withdrawn from the U.S. market in 1997 after studies demonstrated that it caused serious heart valve damage, propranolol – a prescription beta blocker drug that can pose a risk to people with bronchial asthma and certain heart conditions, sibutramine – a controlled substance and prescription weight loss drug, sibutramine was the subject of a recent study whose preliminary findings showed an association between sibutramine use and increased risk of heart attack and stroke in patients who have a history of heart disease, & ephedrine –a stimulant drug that is legally marketed over-the-counter for temporary asthma relief but can pose a risk to people with cardiovascular disease.

FDA Aug/10 lab analysis of **Solo Slim** was found to contain the undeclared drug ingredient Didesmethyl Sibutramine.

FDA July/10 lab analysis of **Slim-30** Herb Supplement distributed by the company was found to contain undeclared N-Desmethyl Sibutramine & Sibutramine.

FDA July/10 lab analysis of this herb supplement, **Joyful Slim** Herb Supplement, was found to contain the undeclared drug, desmethyl sibutramine.

FDA Oct/10 notified consumers that **Slimming Beauty Bitter Orange Slimming Capsules** contain sibutramine, a prescription-only drug which is a stimulant.

FDA Dec/10 has received multiple reports of adverse events associated with the use of **Fruta Planta**, including several cardiac events and one death. FDA lab analysis confirmed that Fruta Planta contains sibutramine.

FDA Jan/11 laboratory analysis confirmed that **Celerite Slimming Capsules** contain sibutramine

FDA Mar/11 lab analysis of **Svelte 30** orange & gray capsules determined that the product contains Sibutramine.

FDA Mar/11 notified Biotab Nutraceuticals, Inc. that two lots of counterfeit product purporting to be **Extenze** contain undeclared drug ingredients. Specifically, lot 0709241 contains tadalafil and sildenafil, and lot 0509075 contains tadalafil and sibutramine.

FDA Mar/11 laboratory analyses of **Celerite Slimming Tea**: Recall - were found to contain undeclared Sibutramine.

FDA May/11 laboratory analysis confirmed that "**Slim Xtreme Herbal Slimming Capsule**" contains sibutramine.

FDA July/11 is advising consumers not to purchase or use "**Slim Forte Slimming Capsules**," "**Slim Forte Slimming Coffee**," and "**Botanical Slimming Soft Gel & Slim Forte Double Power Slimming Capsules**. FDA laboratory analysis confirmed that these products contain sibutramine.

FDA Dec/11 took joint action against several companies selling over-the-counter **hCG products** that falsely and illegally claim to promote weight loss. Labeled "homeopathic" by the seven companies who received the letters, the products contain human chorionic gonadotropin (hCG), a hormone produced during pregnancy by cells that form the placenta. 1. HCG Diet Direct LLC- HCG Diet Homeopathic Drops, 2. The hCG Drops LLC- Homeopathic HCG, 3. HCG Platinum LLC; RightWay Nutrition- HCG Platinum, HCG Platinum X-30, HCG Platinum X-14, 4. FDA Feb/12 is advising consumers not to purchase or use "**Japan Weight Loss Blue**," a product for weight loss sold on various websites, laboratory analysis confirmed that "Japan Weight Loss Blue" contains sibutramine, analogs of sibutramine, and ephedrine alkaloids.

FDA Apr/12 laboratory analysis confirmed that "**Japan Rapid Weight Loss Diet Pills Yellow**" contains sibutramine and phenolphthalein.

Finucane MM, Stevens GA, Cowan MJ. **National, regional, and global trends in body-mass index since 1980**: systematic analysis of health examination surveys and epidemiological studies with 960 country-years and 9.1 million participants. Lancet 2011; DOI: 10.1016/S0140-6736(10)62035-5.

Health Canada April 2007: The **Safe Use of Health Products** for Weight Loss. http://www.hc-sc.gc.ca/iyh-vsv/med/weight-amaigr_e.html

Health Canada Apr/07 is warning consumers about **Bitter orange** & cardiovascular reactions in the Canadian Adverse Reactions April 2007 Newsletter.

Health Canada Apr/07 is warning consumers from the Hong Kong Department of Health found **Lexscl Fat Rapid Loss capsules to be adulterated with sibutramine** and thyroid hormones.

Health Canada via July/07 Medsafe also advised the public not to use the product **Dai Dai Hua Jiao Nang** because it was found to contain sibutramine.

Health Canada Aug/07 is advising Canadians of a recall in the United States of one lot of **Metaboslim Apple Cider Vinegar**, which is marketed as a dietary supplement, because it has been found to contain sibutramine, a prescription medication that should only be taken under medical supervision.

Health Canada Sept/07 is advising consumers not to use foreign health products due to concerns about possible side-effects: **Jacaranda**, **Queenmer Fat Loss**, **Li Da**

TOP

Dai Dai Hua Jiao Nang, **J-minus** and **Jelimel Slimming Capsules**. These products are promoted for weight loss and have been found to be adulterated with the prescription drug sibutramine. Sibutramine is used for treating obesity and should only be taken under the supervision of a health professional. **Junyu Jiaonanyihao** has been found to contain the undeclared prescription drugs sibutramine and dexamethasone, as well as phenolphthalein, which is currently prohibited in Canada.. **Heng Tong Jiangtangning Jiaonang** was found to contain the prohibited drug phenformin, and the prescription drug glibenclamide (glyburide) which should only be taken under the supervision of a health professional.

Health Canada Jan/08 is warning Canadians not to use the unauthorized product **Physio Care Lida Dai Dai Hua Jiao Nang Slimming Capsules** (batch number 28012007 / expiration date: Jan 2009). This product is promoted for weight loss and has been found to contain a derivative of the prescription drug sibutramine.

Health Canada April/08 is advising consumers not to use **Xian Zhi Wei II** was found to contain sibutramine and phenolphthalein, which are not meant for self-care and may cause serious side effects.

Health Canada Aug/08 is advising consumers not to use 9 foreign health products due to concerns about possible side-effects: **Dan Bai Shou Shen Su** was found to contain undeclared thyroid hormones and sibutramine. **Karntien and Karntien Easy to Slim** were adulterated with sibutramine and a compound that is similar in structure to sibutramine (N-desmethylsibutramine). **More Slim** was found to contain the undeclared pharmaceutical ingredient sibutramine. **Soloslim** was found to contain an undeclared substance similar in structure to the prescription drug sibutramine. It also contains the prescription drug L-carnitine, as well as synephrine, which is not authorized for sale in weight loss products in Canada.

Health Canada Aug/08 is advising consumers not to use 8 foreign health products due to concerns about possible side-effects: The Hong Kong Department of Health warned against the use of Natural (Xin Yi Dai) and Lasmi because Natural (Xin Yi Dai) was found to contain sibutramine and phenolphthalein, and Lasmi was found to contain sibutramine and spironolactone. The Hong Kong Department of Health warned against the use of AA Qu Feng Shu Jin Wan because it was found to contain the undeclared pharmaceutical ingredient dexamethasone. Apisate contained fenfluramine and Energy ll contained sibutramine. Obat Asam Urat and Asam Urat both contained dexamethasone, phenylbutazone and piroxicam. The Hong Kong Department of Health warned against the use of Slim 3in1 (Xiao Nan zhi Bao) because it was found to contain the undeclared pharmaceutical ingredients sibutramine and phenolphthalein.

FDA Propylthiouracil-Induced Liver Failure June/09 FDA has identified 32 AERS cases (22 adult and 10 pediatric) of serious liver injury associated with propylthiouracil use. Of the adult cases, 12 deaths and 5 liver transplants occurred. Among the pediatric patients, 1 case resulted in death and 6 in liver transplants. In contrast, for methimazole 5 AERS cases of serious liver injury were identified. All five cases were in adult patients and 3 resulted in death. (**April 21, 2010**: Propylthiouracil: FDA has added a Boxed Warning to the label for propylthiouracil, to include information about reports of severe liver injury and acute liver failure, some of which have been fatal, in adult and pediatric patients using this medication. A boxed warning has been added to the hyperthyroidism drug propylthiouracil (PTU) to alert clinicians about the drug's risk for severe liver injury, the FDA announced on Wednesday. The new labeling is based in part on postmarketing safety reports of severe liver injury — including 15 deaths — in 23 adult and 11 pediatric patients taking PTU. A warning about the potential dangers of the drug was issued by the agency last June. The FDA recommends that PTU only be used in patients who cannot tolerate methimazole or other treatments for hyperthyroidism and in women just before and during their first trimester of pregnancy. Patients will now receive a medication guide upon filling a prescription for PTU. FDA drug safety communication)

Bach-Huynh TG, Nayak B, Loh J, et al. Timing of Levothyroxine Administration Affects Serum Thyrotropin Concentration. J Clin Endocrinol Metab. 2009 Jul 7. [Epub ahead of print]. Non-fasting regimens of levothyroxine administration are associated with higher and more variable serum thyrotropin concentrations. If a specific serum thyrotropin goal is desired, thereby avoiding iatrogenic subclinical thyroid disease, then fasting ingestion of levothyroxine ensures that thyrotropin concentrations remain within the narrowest target range.

Levothyroxine treatment of clinical hypothyroidism in pregnancy is already standard practice given the documented benefits from earlier non-randomised studies. Whether levothyroxine should be utilised in autoimmune and subclinical hypothyroidism remains to be seen, but it may prove worthwhile, given a possible reduction in preterm birth and miscarriage.Selenomethionine as an intervention in women with thyroid autoantibodies is promising, particularly in reducing postpartum thyroiditis. There is a probable low incidence of adverse outcomes from levothyroxine and selenomethionine. High-quality evidence is lacking and large-scale randomised trials are urgently needed in this area. Until evidence for or against universal screening becomes available, targeted thyroid function testing in pregnancy should be implemented in women at risk of thyroid disease and levothyroxine utilised in hypothyroid women.

Available at: http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/DrugSafetyInformationforHeathcareProfessionals/ucm162701.htm . Accessed February 9, 2010.

Given these potential adverse effects, the FDA issued an alert on June 4, 2009 that noted the risk of serious liver injury, including liver failure and death, with the use of PTU in adult (1:10,000) and pediatric (1:2,000) patients. These conferences focused on the relative safety of methimazole compared with PTU.[11-14,16] Approximately 30% of patients treated with PTU will have 1- to 2-fold elevations of serum aminotransferase levels. The liver disease associated with PTU can be severe. In the Adverse Event Reporting System (AERS), approximately 22 adult (12 deaths, 5 hepatic transplants) and 10 pediatric (1 death, 6 hepatic transplants) cases of serious hepatic injury associated with PTU treatment were reported. Methimazole, by contrast, was associated with 5 adult cases of serious hepatic injury with 3 deaths. In a system that may overlap with AERS, the United Network for Organ Sharing reported 23 hepatic transplants from 1990 to 2007 (16 adult, 7 children) related to PTU-associated hepatic failure.[11-13,16] Concurrently, no liver transplants related to the use of methimazole were reported. The average PTU dose in children and adults requiring liver transplant was 300 mg daily. Liver failure occurred between 6 and 450 days after starting treatment (median 120 days). Furthermore, there were 2 reports of serious maternal liver disease during pregnancy and 2 reports of liver injury in fetuses of mothers who ingested PTU during pregnancy.[11-14,16]

RxFiles provides objective, comparative, evidence informed drug information for drug therapy decision making. One hallmark of the program is the academic detailing service or "office visit discussions" provided for physicians/others in Saskatchewan, Canada. A second hallmark that has evolved is the RxFiles Drug Therapy Charts book. For more information on our academic detailing, book, app or online info & services, see our website at www.RxFiles.ca.

Book Orderform: http://www.rxfiles.ca/rxfiles/uploads/documents/1A-CHT-Book-ORDERFORM.pdf
Online store: http://www.rxfiles.ca/rxfiles/modules/products/products.aspx

RxFiles is funded for academic detailing in SK by Saskatchewan Health. Production and updating of our drug comparison charts book is provided via additional revenue from the sale of books and online subscriptions. We are a not-for-profit information program. RxFiles does not receive any funding from the pharmaceutical industry.

TOP

Cochrane reviews CD:

- TNF-a for induction: data not combined. One RCT indicates single infusion may induce remission. CDP571 may induce remission; no evidence for etanercept. Need longer f/u to assess SE such as TB & lymphoma.
- MTX for induction: data not combined. Evidence from a single large trial suggests benefit of MTX 25 mg IM weekly for induction of remission & complete withdrawal from steroids in refractory disease. No evidence supports lower dose PO MTX.
- CsA for induction: low dose PO CsA does not induce remission. Higher PO or IV doses not adequately evaluated, but ↑risk SE such as nephrotoxicity. One study found clinical improvement on unvalidated scale, but remission not assessed.
- AZA and 6-MP effective for inducing remission (NNT=5); OR increases after 17 weeks of tx; NNT=3 for steroid sparing effect; NNT for SE=14.
- Budesonide: superior to placebo for induction & superior to mesalamine; budesonide was inferior to prednisone/prednisolone, but fewer SE. Note: in disease limited to ileum or ascending colon.
- Natalizumab: superior to placebo for induction, but trials halted after 2 cases fatal progressive multifocal leukoencephalopathy in MS.
- Corticosteroids superior to enteral nutrition therapy for induction.
- 5-ASA not superior to placebo in maintaining remission in CD.
- PO budesonide 6 mg/day not effective in maintaining remission.
- Anti-tubercular tx for maintaining remission: may be effective when remission induced by corticosteroids combined with anti-TB tx; however, this is based on subgroup analyses of 2 trials with small numbers
- Corticosteroids (maintenance): not effective and increased AE.
- Probiotics (maintenance): Lactobacilli GC, E. coli strain Nissle 1917, VSL#3, Saccharomyces boulardii-all not effective, but may be due to small sample size
- AZA (maintenance): effective NNT=7 for maintenance; NNT=3 for steroid sparing; NNH=19.

Cochrane reviews UC:

- 5-ASA superior to placebo to induce remission in UC & trended towards benefit over sulfasalazine (SSZ). However, cost an issue, therefore SSZ generally preferred. 5-ASA has fewer SE than SSZ. 5-ASA not associated with male infertility, but SSZ is.
- 5-ASA superior to placebo in maintaining remission for UC (NNT=6). 5-ASA NOT superior to SSZ (NNT= -19), indicating SSZ superior. HOWEVER, many trials required tolerance of SSZ as part of inclusion criteria (Bergman 2006)
- Transdermal nicotine superior to placebo for inducing remission in UC, however no benefit was seen when compared to standard therapy (oral prednisone or mesalamine). More patients on transdermal nicotine withdrew due to AE then placebo or standard therapy.
- Only 2 small trials identified for CsA; could not be pooled as major differences in design & patients involved. Quick response rates in severe disease appear beneficial, but long-term effects unknown.
- In moderate-severe, refractory disease, infliximab induces remission. NNT=5 at 8 weeks (based on ACT studies alone)
- Systematic review: Combination topical & oral 5ASA superior to oral 5ASA for induction of remission of mild-mod UC. Intermittent topical 5ASA superior to oral for prevention of relapse of quiescent UC.[Ford et al.]

88. Strate LL, Liu YL, Syngal S, et al. Nut, corn, and popcorn consumption and the incidence of diverticular disease. JAMA. 2008 Aug 27;300(8):907-14. In this large, prospective study of men without known diverticular disease, nut, corn, and popcorn consumption did not increase the risk of diverticulosis or diverticular complications. The recommendation to avoid these foods to prevent diverticular complications should be reconsidered.
89. Kitazaki S, Mitsuyama K, Masuda J, et al. Clinical trial: comparison of alendronate & alfacalcidol in glucocorticoid-associated osteoporosis in patients with ulcerative colitis. Aliment Pharmacol Ther. 2008 Nov 25. [Epub ahead of print] Our study indicates that alendronate is a safe, well tolerated, and more effective therapy than alfacalcidol for preventing glucocorticoid-associated bone loss in patients with ulcerative colitis.
90. Infliximab for the treatment of acute exacerbations of ulcerative colitis NICE Guidance Dec 2008 http://www.nice.org.uk/TA163
91. Kane S, Ford J, Cohen R, Wagner C. Absence of Infliximab in Infant Sera and Breast Milk From Nursing Mothers Receiving Therapy for Crohn's Disease Before and After Delivery. J Clin Gastroenterol. 2009 Jan 12. [Epub ahead of print]n=3. Infliximab was detected in the mothers' sera, but not in the breast milk of nursing mothers or in the sera of the breast-fed newborns. Data from this small series of patients suggest that infliximab was not transferred from mother to child, either in utero or through breast milk. These data suggest that mothers receiving infliximab should not be discouraged from nursing their children.
92. Turner D, Zlotkin SH, Shah PS, Griffiths AM. Omega 3 fatty acids (fish oil) for maintenance of remission in Crohn's disease. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD006320. Omega 3 fatty acids are safe but probably ineffective for maintenance of remission in CD. The existing data do not support routine maintenance treatment of Crohn's disease with omega 3 fatty acids.
93. Prefontaine E, Sutherland LR, Macdonald JK, Cepoiu M. Azathioprine or 6-mercaptopurine for maintenance of remission in Crohn's disease. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD000067. Azathioprine and 6-mercaptopurine are more effective than placebo for maintenance of remission in Crohn's disease. Higher response rates were obtained with azathioprine than 6-mercaptopurine. However, the one study evaluating 6-mercaptopurine used a relatively low dose of the drug. Future studies should look at the effect of higher doses of 6-mercaptopurine. There is weak evidence for a steroid sparing effect with azathioprine treatment.
94. Benchimol EI, Seow CH, Otley AR, Steinhart AH. Budesonide for maintenance of remission in Crohn's disease. Cochrane Database Syst Rev. 2009 Jan 21;(1):CD002913. Budesonide is not more effective than placebo or weaning prednisolone for maintenance of remission in Crohn's disease. Some modest benefits are noted in patients receiving budesonide compared with placebo in terms of lower CDAI scores and longer time to relapse of disease. However, these benefits are offset by higher treatment-related adverse event rates and more frequent adrenocorticoid suppression in patients receiving budesonide. Therefore, budesonide is not recommended for maintenance of remission in Crohn's disease.

Effect of a Probiotic Preparation (VSL#3) on Induction and Maintenance of Remission in Children With Ulcerative Colitis. Am J Gastroenterol. 2009 Jan 20. [Epub ahead of print] This is the first pediatric, n=29, randomized, placebo-controlled trial that suggests the efficacy and safety of a highly concentrated mixture of probiotic bacterial strains (VSL#3) in active UC and demonstrates its role in maintenance of remission.
97. Levine A, Kori M, Dinari G, Broide E, Shaoul R, Yerushalmi B, On A, Bujanover Y, Pröls M, Greinwald R; Israeli Pediatric Budesonide Study Group. Comparison of two dosing methods for induction of response and remission with oral budesonide in active pediatric Crohn's disease: A randomized placebo-controlled trial. Inflamm Bowel Dis. 2009 Feb 19. [Epub ahead of print] Group 1: Standard dose budesonide (9 mg/day) for 7 weeks followed by 6 mg budesonide daily for an additional 3 weeks. Group 2: Induction with 12 mg/day for the first month followed by the same regimen as Group 1. Use of an induction dose of budesonide followed by a budesonide taper resulted in a trend to higher rates of clinical remission and a decrease in inflammation, without an increase in steroid-associated side effects. Budesonide was also useful for patients with ileocolonic disease.
98. Patel H, Barr A, Jeejeebhoy KN. Renal effects of long-term treatment with 5-aminosalicylic acid. Can J Gastroenterol. 2009 Mar;23(3):170-6. The present study is the first to demonstrate a significant dose- and treatment duration-dependant decline in CrCl.

Jafri NS, Hornung CA, Howden CW. Meta-analysis: **Sequential Therapy** Appears Superior to Standard Therapy for Helicobacter pylori Infection in Patients Naive to Treatment. Ann Intern Med. 2008 May 19. [Epub ahead of print] Sequential therapy appears superior to standard triple therapy for eradication of H. pylori infection. If RCTs in other countries confirm these findings, 10-day sequential therapy could become a standard treatment for H. pylori infection in treatment-naive patients.
